1.0 INTRODUCTION

This Preliminary Assessment (PA) report documents the evaluation of potential sources of per- and polyfluoroalkyl substances (PFAS) related to the use and storage of aqueous film forming foam (AFFF), by the Tucson Airport Authority (TAA) at Tucson International Airport (TUS), a commercial service airport, in accordance with Federal Aviation Administration, Federal Aviation Regulations Part 139 (firefighting). The TAA is proactively initiating this PA, in accordance with the United States Environmental Protection Agency (USEPA) Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), to evaluate the potential release of PFAS to be protective of human health and the environment. Parsons Environment & Infrastructure Group Inc. (Parsons) is conducting the PA in accordance with the USEPA *Guidance for Performing Preliminary Assessments Under CERCLA* (USEPA, 1991) to employ a consistent framework.

This PA evaluates the potential release of PFAS from each AFFF area of concern (AOC). The approach includes a review of historical documents and other relevant document searches, followed by interviews with airport personnel with knowledge of past or current operations involving the sites being assessed. Information contained in this PA report is comprised of information that airport and tenant personnel provided through correspondence with the team and through interviews virtually or during the site visit. A map of TUS is provided in **Figure 1**. Thirty-eight (38) potential AFFF AOCs were identified during the PA, as summarized in **Table 1**, and evaluated in detail in Section 3.0 Fire Training Areas and Section 4.0 Non-Fire Training Areas of this report. Given the large size of the TAA property, the area of TUS which includes potential AFFF AOCs has been divided into three zones, numbered Zone 1 through Zone 3 (**Figures 2** through **4**). For each of these zones, the description, operational history, waste characteristics, migration pathways, and hazard assessments are discussed in Sections 3.0 and 4.0.

1.1 PURPOSE AND OBJECTIVES

The purpose of this PA report is to present the results of assessments conducted to identify locations at TUS where the use or storage of AFFF may have resulted in the potential release of PFAS that poses a potential threat to human health and/or the environment. PFAS are used in numerous industrial applications and products, as described below.

The objective of this PA report is to differentiate between a site that poses little or no potential threat to human health and the environment, and a site that warrants further assessment. If the PA concludes that a site warrants further assessment, PA sampling for the potential AFFF PFAS source will be recommended to further evaluate the potential for release through environmental sampling and analysis. If information collected during the PA suggests that PFAS were not released to the environment, the site will be recommended for no further remedial action planned (NFRAP) with no additional investigations.

1.2 PFAS BACKGROUND

PFAS are a large family of synthetic organic substances first produced in the late 1930s. These substances present a hydrophilic functional group and a hydrophobic chain containing partially or fully fluorinated carbons. Because of their carbon-fluorine bonds, PFAS generally do not readily degrade by most natural processes. They are thermally, chemically, and biologically stable and are resistant to biodegradation, atmospheric photooxidation, direct photolysis, and hydrolysis. Toxicological studies have raised concerns regarding the bioaccumulative nature and potential health concerns of some PFAS. However, their impact on human health and the environment is not entirely understood (USEPA, 2019; Interstate Technology and Regulatory Council [ITRC], 2022).

Since the late 1960s, PFAS have been included in formulations of AFFF. PFAS surfactant properties allow for quick extinguishment of Class B fuel fires through retention of water and separation of fuel from fire ignition sources. Because of this, the United States Department of Defense (US DOD) required the inclusion of PFAS (fluorocarbon surfactants) in its AFFF specification (MIL-F-24385) from the late 1960s until 2019. In 2019, the military specification was amended to remove the requirement of fluorocarbons in AFFF; however, the fire extinguishing performance requirements remained the same; currently only AFFF products containing PFAS can meet the MIL-F-24385 requirements. Since the implementation of minimum safety standards from the Airport and Airway Development Act of 1970, airports certified under Part 139 were required to use AFFF that can meet this military specification (National Academies of Sciences, Engineering, and Medicine [NASEM], 2023).

Long-chain PFAS used in eight carbon based (C8) AFFF, specifically perfluorooctanoic acid (PFOA) and perfluorooctane sulfonic acid (PFOS), are recognized as persistent, bioaccumulative, and toxic (ITRC, 2022). As of September 2019, C8 AFFF has been removed from use in the TAA Fire Department, properly disposed of, and replaced with short-chain six carbon based (C6) AFFF, approved under the USEPA's Stewardship Program (Tucker and Delgadillo, 2023, **Appendix B**, Interviews and Site Visit Notes). C6 PFAS are currently considered lower in toxicity and have significantly reduced bioaccumulation potential compared to C8 PFAS (ITRC, 2022 and USEPA, 2019). It is unknown whether TAA tenants have transitioned from C8 to C6 AFFF.

The US DOD has recently released MIL-PRF-32725 (US DOD, 2023), the performance specification for fluorine-free foam (known as FFF or F3). This specification is in addition to MIL-F-24385, which lists the performance specification of AFFF (NASEM, 2023). The Federal Aviation Administration recently issued a Part 139 CertAlert notifying airport operators of the Availability of F3 on the Navy's Qualified Products List (QPL) (Federal Aviation Administration [FAA], 2023).

1.3 PRELIMINARY ASSESSMENT METHODS

This PA report was prepared in accordance with the *Guidance for Performing Preliminary Assessments Under CERCLA* (USEPA, 1991) and the *Federal Facilities Remedial Preliminary Assessment Summary Guide* (USEPA, 2005).

PA activities included the following:

- Kickoff meeting with TAA relevant staff;
- Records search and review via various readily available sources of information from TAA, regulatory agencies, and public sources that pertain to the potential for AFFF use or storage at TUS;
- Review of records including operational histories, facility investigations, historical aerial photographs, incident/spill reports, material/chemical inventories, material safety data sheets/safety data sheets, permits, and other similar records;
- An environmental data records search to document nearby populations and record water supply well and wetlands information;
- Interviews with local stakeholders and individuals who have specific or anecdotal knowledge of potential sources or processes that could have potentially used or stored AFFF. Interviewees included fire department personnel, environmental managers, tenant facility managers, tenant fire protection contractors, and other personnel familiar with specific building/facility operations and AFFF use; and,
- A site visit on September 11 and 12, 2023, which included personnel interviews, review of on-site documentation, and a tour of each potential AFFF area.

2.0 AIRPORT BACKGROUND AND SETTING

The Tucson Airport Authority (TAA), federally certificated operator of Tucson International Airport (TUS), operates, maintains, and develops TUS as an essential government function under Arizona law. TAA also owns, operates, maintains, and develops additional land beyond the TUS airport terminal and airfield. The overall property includes approximately 8,343 acres and consists of numerous parcels of undeveloped land purchased by TAA that are not leased from the City of Tucson. Geographically, TUS is situated near both Interstates 10 and 19 approximately 8 miles south of downtown Tucson (**Figure 1**). TUS is located in Pima County, Arizona. Some airport land is owned by the City of Tucson, and the TAA has a long-term lease through 2098 for its use to support TUS.

In the 1940s, the City of Tucson separated its military and civilian operations, designating what is now Davis-Monthan Air Force Base (DM AFB) to be used for military operations and training. TUS, which at the time was known as Tucson Municipal Field, would be used primarily for civilian operations. In 1941, the City of Tucson purchased the land 4.5 miles southwest of DM AFB where TUS is situated today. In 1948, a non-profit corporation, comprised of 15 municipal leaders, was formed to operate TUS and by state charter, and on April 12, 1948, became the TAA. The TAA also manages Ryan Airfield (RYN), located 12 miles west of Tucson. Military operations started at TUS in 1956 when the Arizona Air National Guard (AANG) established a base. Shortly after, as a result of increased air traffic, an air traffic control tower was built and in the 1960s the first passenger terminal building was constructed (HNTB, 2014).

On the northern border of TUS, the Morris Air National Guard (ANG) Base, also referred to as Arizona Air National Guard (AANG), occupies 94 acres and hosts the AANG 162nd Wing. The base was built beginning in 1956. The AANG has trained tactical fighter pilots since 1958. Residential areas are located to the north and west, industrial areas are northeast and southwest of TUS, and undeveloped land is located south and east (**Figure 1**).

On the southwest border of TUS is Air Force Plant 44 (AFP 44), a government-owned, contractor-operated defense industrial plant. AFP 44 was constructed by Hughes Aircraft Company in 1951 and was sold to the Air Force in that same year. In December 1997, Hughes Aircraft Company merged with Raytheon and has been operated by Raytheon since the merger. AFP 44 has been used for production of weapons systems since its inception in 1951 (Ayuda, 2018).

2.1 GEOLOGY

TUS is located on the western edge of the Tucson Basin. The Tucson Basin is a large extensional basin within the Catalina Detachment Fault Zone which is part of the larger Basin and Range Geologic Province of the southwestern United States. The Santa Cruz Fault trends north-south along the western boundary of TUS with additional unnamed faults located to the east. The Cenozoic geologic history of the Tucson Basin was affected by two major tectonic events, the mid-Tertiary Orogeny (mountain building events) and the more recent Basin and Range Orogeny. The Basin and Range Orogeny began approximately 17 million years ago, during the middle Miocene and ended around 1.8 million years ago during the late Pliocene and early Pleistocene (USGS, 1988). The Basin and Range Orogeny transformed the landscape of the basins from an area of generally moderate relief into one of high relief characterized by deep structural basins bounded by high mountain ranges (Houser, et al., 2005).

During the Basin and Range Orogeny, the Tucson Basin formed when normal fault bounded mountain ranges were uplifted and the valley, or hanging wall, down-dropped. Cross sections constructed for the United States Geological Survey (USGS) indicate the Santa Cruz normal extensional fault roughly follows South Nogales Highway, which runs north-south, just west of TUS (Anderson, 1987). Basin deposits are substantially thicker (hundreds of feet) east of this fault and include gypsiferous and anhydrite evaporite deposits at a depth of 500 to 1000 feet (Anderson, 1987). Following each Orogeny, the basin would fill with sediment (aggrade) and the

sediment would be reworked by a combination of fluvial and aeolian forces, depending on the climatic forces in effect at the time (degrade), creating eroded surfaces upon which subsequent sediments were deposited (Anderson, 1987). The depositional environment appears to initially have been alluvial fans entering a playa or lake as the basin filled (arid conditions leading to playa formation and humid conditions leading to lake formation) as a hydrologically closed system, shifting to the river system as water breached the north end of the basin, opening the system and allowing the basin to drain. The evaporite deposits mentioned above are characteristic of a playa (closed, arid) system and their uppermost extent marks the boundary between the closed and open system environments.

The sediments that underlie the site have been characterized as belonging to four broad, basin-wide stratigraphic units in descending stratigraphic order: unconsolidated surficial deposits, Fort Lowell Formation, the Tinaja Beds, and the Pantano Formation (Anderson, 1987). These designations are primarily age-based using the position of unconformities related to ancient erosional events (Anderson, 1987) and do not represent either lithologic or depositional characteristics. Therefore, there is substantial variability in the materials encountered within these formations.

Surficial deposits (alluvium) are composed of discontinuous sedimentary deposits that range from modern stream alluvium to alluvial fan deposits that overlie the Fort Lowell Formation. Transitioning northward, the surficial deposits consist of mainly stream alluvium with fewer alluvial fan deposits in the northern portion of the study area. The deposits consist of mainly interbedded sands, gravels, silts, and clays. Depth of the surficial alluvial deposits ranges from a few feet to approximately 30 feet (ft) below ground surface (bgs).

The Fort Lowell Formation, the youngest formation of Pleistocene age consists predominantly of silty gravel near the basin margins, with increasing silty sand and clayey silt content toward the central part of the basin and extends to depths of approximately 200 to 250 feet. The Fort Lowell formation accumulated during the development of the Santa Cruz River system. The Fort Lowell Formation is 300 to 400 feet thick near the center of the basin and thins towards the mountains.

The Tinaja Beds of Miocene and Pliocene age are divided into three sub-units: Upper, Middle, and Lower Beds. The middle and upper Tinaja Beds were deposited during the main period of uplift (early to mid-Tertiary) before the development of flow through the basin led to development of the Santa Cruz River system. The Tinaja Beds are comprised of sand and gravel at the margins of the basin and with an increasing clayey silt and mudstone content in the central portions of the basin, extending to a depth of approximately 250 to 300 feet bgs.

The Pantano Formation, the oldest unit of Oligocene age, is a reddish-brown, silty sandstone, that includes gravel with interbedded volcanic flows and tuffaceous sediments. The Pantano Formation was deposited during the main period of uplift in the early to mid-Tertiary before the development of flow through the basin. The thickness of the Pantano Formation is estimated to range from a few hundred to 1,000 feet.

The dominant soil type at the site is Sahuarita-Mohave Complex. The Sahuarita soil series consists of deep, well-drained soils formed on alluvial fan terraces in mixed calcareous alluvium. Typically, these soils have light yellowish brown, very gravelly, fine sandy loam surfaces that are about three inches thick (Science Applications International Corporation [SAIC], 1985).

2.2 HYDROGEOLOGIC SETTING

The regional hydrogeologic setting at TUS generally consists of coarse, relatively permeable units of sands and gravels laid down as vertically and horizontally grading stream and channel deposits associated with the ancient Santa Cruz River system, bounded by fine-grained, less permeable units of fine sands, silts, and clays of the ancient flood plain (Environmental Geoscience, and Construction Management, Inc. [EGC], 2016).

The regional aquifer appears to be sequences of ancient channels of the Santa Cruz River. Other, smaller permeable units embedded in fine-grained material appear to be remnants of side streams that crossed the ancient floodplains, or crevasse-splay networks that drained floods through the levees of the ancient channels.

Based on previous hydrogeologic studies (EGC, 2016), the following sections describe individual hydrostratigraphic units underlying TUS. Because these units are each sequences of deposits rather than distinct deposits, they are sometimes highly eroded and may disappear and reappear. Furthermore, these are fluvial deposits and individual units are often not as extensive as deposits formed in other depositional environments. Fluvial deposits commonly grade laterally, meaning the textural descriptions given of samples from the same unit at differing locations may vary.

2.2.1 Alluvial Fan and Surficial Units

Deposits in the vadose or unsaturated zone are clays, silts, and fine sands of levee-overbank deposits; and well-sorted sands and gravels of channel deposits and are as deep as 100 feet bgs. Calcified silty fine sand or caliche beds are present in many areas, starting at five to 10 feet bgs and extending discontinuously to varying depths. Groundwater is not typically present within this unit. There are no drinking or public water supply wells in these units, according to the Arizona Department of Water Resources (ADWR) database (ADWR, 2017).

2.2.2 Alluvial Fan Aquitard

The Alluvial Fan Aquitard is an overbank deposit comprised of layered clays, silts, and fine sands, with occasional thin coarse-grained layers resulting from levee breaks (crevasse splay deposits) or streams crossing the flood plain. This layer is as thick as 80 feet in some places and overlies the Regional Aquifer. It pinches-out north of Hermans Road and west of South Nogales Highway. The pinch out likely represents a degradation event that eroded the basin. A shallow groundwater zone is contained within this aquitard at a depth of approximately 80 to 100 feet bgs. There are no drinking or public water supply wells in this aquitard, according to the ADWR database (ADWR, 2017).

2.2.3 Upper Aquifer Zone

The upper aquifer zone (Regional Divided Aquifer) consists of sands and gravels with clayey sand and clays to a depth of approximately 200 feet bgs and ranges in thickness from approximately 60 to 100 feet (Earth Tech, 1992). Groundwater of the upper aquifer zone occurs at depths of approximately 100 to 200 feet bgs. Recharge to the aquifer occurs most readily where the unsaturated zone is thin, such as along major streams, but may occur anywhere that substantial amounts of water are applied or collect naturally on a regular basis. Groundwater flow direction is to the northwest.

The upper aquifer zone can be divided into an upper unit and lower unit separated by a discontinuous clay aquitard which is as thick as 80 feet in places. The upper zone aquifer is referred to as the Regional Divided Aquifer. These two transmissive units within the upper aquifer zone may represent laterally inconsistent paleochannels of the Santa Cruz River or alluvial channels of the Cienega Creek Alluvial Fan. In general, the upper aquifer zone shows a gradual coarsening of sediments from east to west. The clay aquitard dividing these two subunits varies in thickness across the site and begins to pinch-out west of South Nogales Highway and the upper zone aquifer becomes undifferentiated. The aquitard consists mostly of clays with some transitional lenses of clayey sands and clayey gravels.

Vertical movement of water between the upper and lower units of the upper aquifer zone would depend largely on the continuity of coarse-grained sediments and thickness and continuity of the fine-grained aquitard. According to the ADWR database (ADWR, 2017), the upper aquifer zone is used as a source of domestic and public water supply.

2.2.4 Lower Aquifer Zone

In general, the lower aquifer zone (Regional Undivided Aquifer) consists of clays, clayey sands, sands, and gravelly sands that are typically more cemented than the upper groundwater zone. The lower aquifer zone is not divided by an aquitard and is therefore referred to as the Regional Undivided Aquifer. Groundwater occurs in the lower aquifer zone under semi-confined conditions and at depths of approximately 300 feet bgs at the site. The total depth of the lower aquifer zone has not been well established in the site footprint, but existing data suggest it reaches depths of up to 600 feet bgs (DBS&A, 1993).

The permeability of the lower aquifer zone is one to two orders of magnitude less than the permeability of the upper aquifer zone because it contains more clay, is more poorly sorted and is more heavily cemented than the lower aquifer zone sediments (Hughes Missile Systems Company, 1995). Aquifer pumping tests have shown no interconnection between groundwater in the upper and lower aquifer zones (EGC 2016). According to the ADWR database (ADWR, 2017), the lower aquifer zone is used as a source of public water supply.

The main source of recharge to the regional aquifer is streamflow that infiltrates along the major channels. When streams are flowing, water moves by gravity down through the sediments to recharge the aquifer. Another major source of recharge is water entering the aquifer margins along the mountain fronts as infiltrated water from many small stream channels and directly from cracks in the rocks of the mountains. Another substantial source of recharge to the regional aquifer is from the subsurface flow of water into the Tucson Basin from Canada del Oro and the Santa Cruz River through the permeable deposits that underlie these streams. Other sources include water returned to the aquifer after having been used for public supply, agriculture, mining, or industrial uses. Imported water also plays a role in local recharge efforts, as Tucson's allocation of Central Arizona Project (CAP) water has been directed into Tucson area aquifers since the early 2000s. In the vicinity of TUS specifically, CAP water is recharged at the CAP Pima Mine Road Recharge site. **Appendix E** includes the results of an Environmental Data Resources, LLC (EDR) DataMap™ Well Search Report within a 1-mile radius of TUS.

2.2.5 Groundwater Use and PFAS Sampling

TUS's potable and non-potable water is supplied by the City of Tucson (Tucson Water), as derived from approximately 150 groundwater wells located in and around the Tucson metropolitan area as part of the Central Well Field (Tucson Water, 2023), which includes wells within 4 miles of TUS. Approximately 25% of the Tucson Water supplied drinking water is coming from the Central Well Field which is used mainly during peak demands and used as a backup from the main water supply source, the Colorado River via the CAP. Tucson Water serves over 240,000 households and businesses.

Some of the Central Well Field wells, located directly northwest of TUS are within the impact of the Tucson International Airport Area Superfund Site (TIAA). The main contaminants of concern within TIAA are trichloroethene (TCE), dichloroethane, chloroform and chromium. PFAS sampling was also conducted, and concentrations have been detected above the 2016 USEPA Health Advisory Level (HAL, 70 nanogram per liter [ng/L]) for the combined concentrations of PFOA and PFOS. In 2019, the Tucson Airport Remediation Project (TARP) groundwater treatment system treating the TCE plume added granulated active carbon to remove PFAS. Tucson Water started to monitor for PFAS in 2009, and PFAS impacted production wells for municipal water supply have been shut down. In June 2021, the TARP plant temporarily shut down due to increasing levels of PFAS in the groundwater wells serving the plant (Tucson Water, 2021). In May 2022, the TARP plant reopened and, with a permit from EPA, treated water was released into the Santa Cruz River. Water treated at TARP is no longer a drinking water source. Tucson Water has been tracking annual sampling results to proactively identify and address potential contaminants of emerging concern issues including PFAS. The results of the annual sampling results are available on the Tucson Water, Sentry Report webpage (Tucson Water, 2024).

In October 2019, Arizona Department of Environmental Quality (ADEQ) conducted groundwater sampling for PFAS in nine private wells near the TIAA Superfund Site downgradient of TUS (Hargis and Associates, Inc. [Hargis], 2020). Samples were analyzed for PFAS by USEPA Method 537 Modified. PFOA and/or PFOS were detected at

eight of nine locations, located to the north, northwest, and west of TUS. The combined PFOA and PFOS concentrations ranged from 4.7 ng/L to 11,400 ng/L. Four out of nine locations were above the 2016 USEPA HAL; these four wells are located to the north and north-northwest of TUS and the Morris ANG Base. One of these wells is a private well used for irrigation only. In October 2019, ADEQ began providing bottled water to the three affected drinking water well users.

In March 2020, the AANG determined a complete exposure pathway exists between on-base PFOS/PFOA release areas at the Morris ANG Base and the three previously sampled off-base drinking water wells located downgradient and in the vicinity of Morris ANG Base and TUS (National Guard Bureau, 2020). Consequently, the AANG took over the distribution of bottled water, which is ongoing. In June 2020, the AANG prepared a Time Critical Removal Action to document its decision to connect the three private drinking water wells to the public water system maintained and operated by the Tucson Water Department and supply bottled water to the three impacted well users until a permanent water supply connection could be provided (National Guard Bureau, 2020). In July 2021, the City of Tucson reported to AANG that one of the three impacted drinking water wells was already connected to municipal water. In June 2022, the National Guard Bureau prepared an Engineering Evaluation/Cost Analysis to support a non-time-critical removal action in response to the presence of PFOS and PFOA above relevant USEPA HALs in drinking water wells on private residential properties downgradient and in the vicinity of Morris ANG Base. In September 2022, the AANG issued an action memorandum to document the decision and approval of the National Guard Bureau to continue providing alternative bottled drinking water to users of two PFOS/PFOA-impacted private drinking water wells attributable to PFOS/PFOA originating from Morris ANG Base, until residential users are connected to City of Tucson Municipal Water (National Guard Bureau, 2022).

2.3 HYDROLOGIC SETTING

The site is relatively flat at a surface elevation of approximately 2,560 feet above mean sea level. No standing water bodies exist at TUS and the majority of surface water runoff will discharge to a facility-wide stormwater drainage system. During moderate to heavy rain events, stormwater outfalls collect runoff and are connected to ephemeral streams: Airport Wash to the north, Valencia Wash to the northwest, and El Vado Wash, Santa Clara Wash and Hughes Wash to the west of TUS (**Appendix D**). Each of these seasonal fluvial systems are tributaries to the larger ephemeral Santa Cruz River, located approximately 2 miles west of TUS. Other surface water flows include drainage channels and subsurface storm drains, which all primarily flow to the west-northwest also towards the Santa Cruz River (USFWS, 2023a).

2.4 HUMAN AND ECOLOGICAL RECEPTORS

For human receptors, common exposure routes include direct contact with soil (incidental ingestion, dermal uptake, and inhalation of fugitive dust); direct contact with groundwater (ingestion/consumption and dermal uptake); direct contact with surface water (incidental ingestion and dermal uptake during swimming, wading, or similar activities); and direct contact with sediment (incidental ingestion and dermal uptake while playing or recreating in surface water). Due to the potential for PFAS to accumulate in the tissues of various organisms including plants (vegetables, berries, etc.), fish, and mammals (deer, cattle, etc.), people can be exposed to PFAS if they eat vegetables or fruits irrigated with PFAS-contaminated water (for example, if PFAS-contaminated groundwater is used to irrigate a vegetable garden), fish or invertebrates caught in PFAS-contaminated surface water, or meat or milk from animals that were fed or foraged on PFAS-contaminated plants (for example, consumption of beef or milk obtained from cows that were pastured on PFAS-contaminated fields).

Potential current and future on-site human receptors may include staff, maintenance workers, office workers, and trespassers/visitors. Potential off-site human receptors could include individuals inclined to interact with potentially impacted surface water and sediment, such as individuals engaged in recreational activities and users of groundwater, including individuals who use groundwater for drinking water.

Ecological receptors include living organisms other than humans, the habitat that supports such organisms, or natural resources that could be adversely affected by environmental contaminants from a release or migration from an identified location. Potentially complete exposure pathways for ecological receptors exposed to contaminated media may include direct contact of plants and animals to soil, direct contact of fish and other aquatic organisms to surface water or benthic organisms to sediment; ingestion of surface water, soil, or sediment; and consumption of contaminated prey or vegetation. The ephemeral streams and wetlands are primary areas for potential ecological receptors, although the streams and wetlands are dry for most of the year due to the arid climate and minimal rainfall (USFWS, 2023a). A riparian corridor crosses the TAA property from northwest to southeast. The riparian corridor is home to a variety of wildlife species including migratory birds, vegetation, and plant species. The regulated riparian areas are located within the TAA property southeast of TUS and do not extend north of East Hermans Road or west of South Country Club Road (PimaMaps, 2023) (**Figure 1**). Conservation lands are not identified within TAA property by the Sonoran Desert Conservation Plan (SDCP); however, the SCDP has mapped Harris Riparian areas in the western portion of TAA property north of AF Plant 44 and south of Runway 04 (formerly Runway 03) (HNTB, 2014; PimaMaps, 2023; SCDP, 2023). Vegetative and wildlife species, including threatened and endangered species, which may be found on TAA property are listed in **Table 2**.

2.5 ADJACENT PFAS SOURCES

PFAS remedial investigations (RI) are ongoing at both Morris ANG Base and AFP 44 (**Figure 1**) (Ahtna Global, LLC, 2023; Sustainment and Restoration Services, LLC, 2023). At the time of writing this PA, both investigations were in the early stages of the field investigation. Documents related to investigations at both Morris ANG Base and AFP 44 are available on the Air Force Administrative Record (<https://ar.afceec-cloud.af.mil/>).

3.0 FIRE TRAINING AREAS

3.1 Zone 1 – Description, Operational History, and Waste Characteristics

3.1.1 AOC 1: TAA Hangars – Former Fire Training Area

Fire training was reported to have been conducted on the north apron directly east of the building complex known as the Three Hangars and south of the Original Fire Station (**Figure 2**) (Tucker, 2023, **Appendix B**, Interviews and Site Visit Notes). The current TAA Fire Chief, Tom Tucker, has worked at TAA since 2000 and has direct knowledge of firefighting operations during that period. No other information is known regarding fire training in this area.

3.1.2 AOC 2: Fire Drill Training Area A-1

A former TAA fire drill training area was located approximately 150 feet east of the intersection of Taxiway A and Taxiway 2 and west of Hangar 10 (Building B-10) (**Figure 2**). Aerial photographs indicate that the feature was active during 1953. The former fire drill training area was used a "few dozen times" in the early 1950s and was paved over sometime prior to 1960. The drill area was enclosed by a circular berm roughly 6 to 8 inches high and 80 feet in diameter and filled with water and fuel likely on top of bare soil. The area is presently covered with a concrete apron (Daniel B. Stephens & Associates, Inc. [DBSA], 1993). This fire training area was closed prior to the initial development of AFFF materials in approximately 1966. No interviewees had direct knowledge of this AOC over the reported operational period.

3.2 Zone 1 – Migration Pathways and Hazard Assessment

3.2.1 Groundwater Pathway

A general overview of TUS geologic and hydrogeological settings is provided in **Sections 2.1** and **2.2**. A summary of PFAS groundwater sampling is provided in **Section 2.2.5**. The general groundwater flow direction within Zone 1 is to the northwest (BB&E, 2016; AECOM, 2019).

There is a potentially complete exposure pathway via groundwater. Some of the wells within 4.0 miles are located hydraulically downgradient of the Zone 1 potential AFFF AOCs.

3.2.2 Surface Water Pathway

The TUS hydrologic setting is described in **Section 2.3**. When sufficient water is present, surface water runoff from the AOC 1: TAA Hangars and AOC 2: Fire Drill Training Area A-1 is collected via storm drains and catch basins, which using a network of underground pipes will convey the water to a stormwater outwash. Overland flow in the vicinity of the AOC 1: TAA Hangars will flow to stormwater outfall #47 located approximately 1,500 feet away. Water from this outwash discharges to the El Vado Wash (**Appendix D**). Overland flow in the vicinity of AOC 2: Fire Drill Training Area A-1 will be captured by the stormwater infrastructure through nearby inlet structures and will either discharge via outfalls #23 and #24 or will flow northwest and discharge from outfall #31 into Airport Wash (**Appendix D**).

TUS is located in a dry subtropical (desert subtype) climate. In the area of the potential AFFF AOCs, there are no established wetlands or ecosystems likely to support the establishment of wetlands. Potential ecological receptors include the aquatic community (fish, aquatic invertebrates, aquatic plants) in direct contact with surface water and benthic invertebrates in direct contact with sediment. Birds and mammals may also ingest contaminated water or prey that have bioaccumulated PFAS from exposure to surface water.

3.2.3 Soil and Air Pathways

The land surface at the AOC 1: TAA Hangars and AOC 2: Fire Drill Training Area A-1 is generally flat and mostly covered with pavement or concrete. There is the potential that AFFF contaminated water infiltrated cracks in the surface cover and impacted the soil beneath.

Human receptors can be exposed via dermal contact with and/or incidental ingestion of soil near the area. Under conditions when impacted surface soil may become dry, inhalation of impacted fugitive dust could cause exposure. Human receptors can also eat food (vegetables, fruits, deer, etc.) that was grown in or raised on PFAS-contaminated soil and wildlife that consumed contaminated plants. Current land use at the two potential AFFF AOCs would be expected to involve limited human health exposures. Future land use at the two potential AFFF AOCs is not expected to change; however, the possibility exists that the surface cover may be removed or replaced.

The nearest residential areas are located approximately 0.1 miles west of the AOC 1: TAA Hangars and 0.8 miles north and west of AOC 2: Fire Drill Training Area A-1. There are no schools or daycare facilities within a 200-ft radius of either potential AFFF AOC in Zone 1; the nearest schools are greater than 0.6 miles away. Based on the distance to human receptors and the land use around the potential AFFF AOCs it is unlikely that human receptors would be impacted via the soil pathway.

Ecological receptors may be exposed to contaminated media via the consumption of plants, invertebrates, and small mammals that accumulated PFAS in their tissues; however, no terrestrial sensitive environments exist within 200 feet of the areas. Because the areas do not present a valuable or attractive habitat to ecological receptors and there are no sensitive environments within 200 feet, there is a low potential for exposure to contaminated media by ecological receptors via the soil pathway.

In terms of air pathways, neutral PFAS such as fluorotelomer alcohols (FTOHs), perfluorooctane sulfonamide (FOSA), and perfluorooctane sulfonamido ethanol (FOSE) are more volatile than negatively charged PFAS. Neutral PFAS have been found in the vapor phase in indoor environments, have been reported in high concentrations in AFFF, and vapor intrusion of these PFAS may occur from AFFF-contaminated groundwater (ITRC, 2023).

3.3 Zone 2 – Description, Operational History, and Waste Characteristics

3.3.1 AOC 3: Abandoned TAA Fire Drill Area

Fire training was reported to have been conducted in the area north of the area described below as AOC 7: Fire Drill Training Area D-6 [former TAA landfill] and south of the Runway 04 (formerly Runway 03) threshold (**Figure 3**) (Tucker, 2023, **Appendix B**, Interviews and Site Visit Notes). The current TAA Fire Chief, Tom Tucker, has worked at TAA since 2000 and has direct knowledge of firefighting operations during that period. No other information is known regarding fire training in this area.

3.3.2 Fire Drill Training Areas

Four previous fire drill training areas are located in the area south of the intersection of Runways 04 and 12 (formerly Runways 03 and 11L) (**Figure 3**). Prior to 1956, only TAA was engaged in fire drills in this area, but after that time the AANG shared the fire drill areas; about 75% of the usage was by the AANG and 25% by TAA. Fire drills generally took place on a monthly basis. The areas were customarily cleared, bermed, and filled with water, after which fuel was poured on top and the area set on fire. Aviation gas, waste aviation fuel (JP-4), diesel, and waste liquids possibly containing solvents from airport tenants and/or the AANG were used for fire drill training (DBSA, 1993). No interviewees had direct knowledge of these AOCs over their reported operational periods.

3.3.2.1 AOC 4: Fire Drill Training Area D-3

This fire drill training area was historically located within an area that is part of the current Bombardier facility, bordered on the north by Bombardier Building E and Building Y, on the south by Aero Park Boulevard, on the west by vacant land within the Bombardier facility, and on the east by Bombardier Building F (**Figure 3**). This area consisted of several drill sites located in an approximate 5-acre area of cleared brush and was used from the mid to late 1960s until 1973, when the new fire training facility was built east of Runway 30 (formerly Runway 29R). Fire drills were conducted with the AANG in the 1960s in which JP-4 was dumped from AANG tank trucks into water-filled berm areas. Large volumes of fuel were used for the larger fires. Large areas of darkened ground in this area are visible in various aerial photographs. This training area was paved over by about 1983 (DBSA, 1993). No known use of AFFF was found in the historical records search or interviews, but the use of AFFF is assumed based on the dates of use.

3.3.2.2 AOC 5: Fire Drill Training Area D-4

This fire drill training area was located just south of the intersection of Taxiway Delta and the former Runway 11R threshold and adjacent and west of the intersection of former Runway 11R and Taxiway Alpha-5 (**Figure 3**); the training area is bordered on the north by the old boneyard salvage area, Taxiway Delta and the former 11R threshold, on the south and west by the abandoned Taxiway and Taxiway C, and on the east by undeveloped land and former Runway 11R. Both TAA and the AANG used this fire drill training area in the late 1950s and 1960s. Fire drill training was less frequent than at AOC 4: Fire Drill Training Area D-3 and ceased after the Runway 22 (formerly runway 21) extension was built in 1969 (DBSA, 1993). This fire training area may have overlapped with the initial use of AFFF.

3.3.2.3 AOC 6: Fire Drill Training Area D-5

According to a former TAA firefighter, this fire drill training area was located in the undeveloped area bordered on the north and west by Taxiway Delta and Runway 04 (formerly Runway 03), on the south by the south ramp, and on the east by the former Runway 11R threshold and the Taxiway Alpha-5 (approximate location of potential AFFF AOC shown on **Figure 3**). Aerial photographs do not show evidence of the location of this fire drill training area. Fire training was infrequent here by the TAA in the early 1950s (DBSA, 1993). This fire training area was closed prior to the initial development of AFFF materials in approximately 1966.

3.3.2.4 AOC 7: Fire Drill Training Area D-6

Fire drills were reported to have taken place in the TAA Landfill located approximately 600 feet northeast of the intersection of East Aero Park Boulevard and South Nogales Highway (**Figure 3**) (Voss, 1987). No other information is known regarding fire drills in this area. The landfill was active from pre-1953 to the mid-1980s and if fire drills were conducted here while the landfill was active, or after, the drills overlap with the time frame of possible AFFF use (DBSA, 1993).

3.4 Zone 2 – Migration Pathways and Hazard Assessment

3.4.1 Groundwater Pathway

A general overview of the TUS geologic and hydrogeological settings is provided in **Sections 2.1** and **2.2**. A summary of PFAS groundwater sampling is provided in **Section 2.2.5**. The general groundwater flow direction within Zone 2 is to the northwest and the depth to groundwater is approximately 80 to 100 feet bgs (Ayuda, 2018).

There is a potentially complete exposure pathway via groundwater. Some of the wells within 4.0 miles are located hydraulically downgradient of the Zone 2 potential AFFF AOCs.

3.4.2 Surface Water Pathway

The TUS hydrologic setting is described in **Section 2.3**. When sufficient water is present, surface water runoff from the AOC 3: Abandoned TAA Fire Drill Area and the Fire Drill Training Areas (AOCs 4, 5, 6, 7) is collected via storm drains and catch basins, which use a network of above ground ditches and underground pipes to convey the water to a stormwater outwash. Generally, the Zone 2 topography slopes gently to the west. Box and pipe culverts convey overland flow in the area of AOCs 5 and 6 (Fire Drill Training Areas D-4 and D-5) towards stormwater outwash #50 located approximately 1,000 feet north of AOC 7: Fire Drill Training Area D-6 and approximately 4,000 feet west of AOC 5: Fire Drill Training Area D-4. Overland flow in the vicinity of AOCs 4 and 7 (Fire Drill Training Areas D-3 and D-6) and AOC 3: Abandoned TAA Fire Drill Area will follow the local topography and flow into stormwater infrastructure associated with nearby roads. Outfall #50 and the nearby road infrastructure discharge into Santa Clara Wash (**Appendix D**).

TUS is located in a dry subtropical (desert subtype) climate. There are no established wetlands or ecosystems likely to support the establishment of wetlands. Potential ecological receptors include the aquatic community (fish, aquatic invertebrates, aquatic plants) in direct contact with surface water and benthic invertebrates in direct contact with sediment. Birds and mammals may also ingest contaminated water or prey that have bioaccumulated PFAS from exposure to surface water.

3.4.3 Soil and Air Pathways

The land surface at AOC 3: Abandoned TAA Fire Drill Area and AOCs 5, 6, and 7 (Fire Drill Training Areas D-4, D-5, and D-6) is generally undeveloped and lightly vegetated soil. Approximately half of the ground surface at AOC 4: Fire Drill Training Area D-3 is covered with concrete or pavement; the eastern portion of the potential AFFF AOC is soil with minimal vegetation. There is the potential that AFFF contaminated water infiltrated into the soil and into cracks in the surface cover and impacted the soil beneath.

Human receptors can be exposed via dermal contact with and/or incidental ingestion of soil near the area. Under conditions when impacted surface soil may become dry, inhalation of impacted fugitive dust could cause exposure. Human receptors can also eat food (vegetables, fruits, deer, etc.) that was grown in or raised on PFAS-contaminated soil and wildlife that consumed contaminated plants. Human exposures at AOCs 5, 6, and 7 (Fire Drill Training Areas D-4, D-5, and D-6) are expected to be minimal due to the current undeveloped land use. There is a greater hazard for human exposure to fugitive dust or dermal exposure to soil at AOC 3: Abandoned TAA Fire Drill Area and AOC 4: Fire Drill Training Area D-3 due to the presence of a tank farm and nearby buildings.

The nearest residential area is located approximately 2,500 feet to the west across the South Nogales Highway from the AOC 3: Abandoned TAA Fire Drill Area and AOC 7: Fire Drill Training Area D-6. There are no schools or daycare facilities within a 200-ft radius of the AOC 3: Abandoned TAA Fire Drill Area and AOCs 4 through 7 (Fire Drill Training Areas). The nearest school is approximately 1 mile northwest of the AOC 3: Abandoned TAA Fire Drill Area. Based on the distance to human receptors and the land use around the potential AFFF AOCs it is unlikely that human receptors would be impacted via the soil pathway.

Ecological receptors may be exposed to contaminated media via the consumption of plants, invertebrates, and small mammals that accumulated PFAS in their tissues; however, no terrestrial sensitive environments exist within 200 feet of the areas. Because the area does not present a valuable or attractive habitat to ecological receptors and there are no sensitive environments within 200 feet, there is a low potential for exposure to contaminated media by ecological receptors via the soil pathway.

In terms of air pathways, neutral PFAS such as fluorotelomer alcohols (FTOHs), perfluorooctane sulfonamide (FOSA), and perfluorooctane sulfonamido ethanol (FOSE) are more volatile than negatively charged PFAS. Neutral PFAS have been found in the vapor phase in indoor environments, have been reported in high concentrations in AFFF, and vapor intrusion of these PFAS may occur from AFFF-contaminated groundwater (ITRC, 2023).

3.5 Zone 3 – Description, Operational History, and Waste Characteristics

3.5.1 AOC 8: Former Fire Training Facility

Located east of the current TAA Fire Station (B-284), in the area south and west of the Airport Wash, immediately northeast of the end of Runway 30 (formerly Runway 29R), and southeast of the air cargo apron, the Former Fire Training Facility was used by the TAA and AANG and was in operation between 1973 and 1989 (**Figure 4**). The inactive Fire Training Facility consisted of two located and one approximately located unlined burn pits, a concrete-lined burn pit, and an oil/water separator (OWS). These burn pits are depicted on **Figure 4** and in the historical supporting figures in **Appendix C**.

The Former Fire Training Facility was active beginning in the mid-1960s but was removed in 1992. The facility was formerly used by TAA and the AANG for the purpose of training firefighting personnel in extinguishing live fires. Originally, three unlined pits were put into operation sometime in the late 1970s. According to a former chief of fire and security, old aircraft were placed inside a bermed area, doused with fuel, and set on fire. Aviation fuels were used, including Avgas, JP-4, and Jet A (DBSA, 1993). Early in the operation of the facility, other flammable materials may also have been used, including waste oil from the AANG OWS, which possibly contained spent solvents. In 1984, TAA retired the unlined pits and constructed a concrete-lined pit. TAA received permission from USEPA Region 9 to operate the improved facility which continued in operation until 1989. The new Fire Training Facility was equipped with a fuel distribution system consisting of two underground storage tanks for storage of waste fuel and piping to distribute the fuel to the lined pit. Waste fuels were mixtures of Avgas, JP-4, and contents of waste fuel tanks from fuel farms. No other nonfuel materials were known to have been used during this period. Approximately 100 to 300 gallons of fuel were used for each fire training exercise (DBSA, 1993). Use of AFFF within the former fire training area was confirmed during interviews of TAA personal (Tucker, 2023, **Appendix B**, Interviews and Site Visit Notes). No interviewees had direct knowledge of this AOC over the reported operational period.

3.5.2 AOC 9: Alpha 17 Runup Pad Fire Training Area

Located southeast of the Former Fire Training Facility and at the southeast end of Taxiway Alpha and Runway 30 (formerly 29R) (**Figure 4**), the Alpha 17 Runup Pad Fire Training Area was used for triennial fire training required by FAA (every 3 years) (Tucker, 2023, **Appendix B**, Interviews and Site Visit Notes). The current TAA Fire Chief, Tom Tucker, has worked at TAA since 2000 and has direct knowledge of firefighting operations during that period. The FAA requires airports to ensure the functionality of foam proportioning systems on firefighting vehicles per FAA FAR Part 139 regulations. Historically, this functionality testing required the discharge of AFFF from firefighting vehicles in order to measure the effectiveness of foam output. Recent FAA changes now allow for the use of closed-loop foam proportioning testing systems, which eliminate the need to discharge AFFF to the environment (NASEM, 2023; FAA, 2021). The Alpha 17 potential AFFF AOC was also used for mock emergency response exercises. Photographs from one event conducted in March 2014 shows AFFF foam and AFFF buckets surrounding an airplane (**Alpha 17**; Arizona LifeLine, 2014; Ziebma, 2014).

3.6 Zone 3 – Migration Pathways and Hazard Assessment

3.6.1 Groundwater Pathway

A general overview of the TUS geologic and hydrogeological settings is provided in **Sections 2.1** and **2.2**. A summary of PFAS groundwater sampling is provided in **Section 2.2.5**. The general groundwater flow direction at AOC 8: Former Fire Training Facility and AOC 9: Alpha 17 Runup Pad Fire Training Area is to the northwest and the depth to groundwater is approximately 80 to 100 feet bgs (DBSA, 1993; Ayuda, 2018).

There is a potentially complete exposure pathway via groundwater. Some of the wells within 4.0 miles of the AOC 8: Former Fire Training Facility and AOC 9: Alpha 17 Runup Pad Fire Training Area are located hydraulically downgradient of the potential AFFF release area.

3.6.2 Surface Water Pathway

The TUS hydrologic setting is described in **Section 2.3**. When sufficient water is present, surface water runoff will follow the topography at the potential AFFF AOCs and generally infiltrate the ground surface. The AOC 8: Former Fire Training Facility surface water runoff likely drains via the topography and above ground drainage ditches directly to the Airport Wash located approximately 2,000 feet to the north. AOC 9: Alpha 17 Runup Pad Fire Training Area surface water runoff is anticipated to reach the south fork of the Airport Wash approximately 2,000 feet to the north (**Appendix D**). Stormwater runoff at the AOC 9: Alpha 17 Runup Pad Fire Training Area may infiltrate the bare ground surface or runoff via airport above ground drainage ditches and allowed to evaporate.

TUS is located in a dry subtropical (desert subtype) climate. There are no established wetlands in proximity to the potential AFFF AOCs; however, riparian areas are mapped within 200 feet of both potential AFFF AOCs and may exposure ecological receptors to contaminated site media during wet periods when water is present in the nearby washes. Potential ecological receptors include the aquatic community (fish, aquatic invertebrates, aquatic plants) in direct contact with surface water and benthic invertebrates in direct contact with sediment. Birds and mammals may also ingest contaminated water or prey that have bioaccumulated PFAS from exposure to surface water.

3.6.3 Soil and Air Pathways

The land surface at AOC 9: Alpha 17 Runup Pad Fire Training Area is paved with native soil on the edges of the potential AFFF AOC. The AOC 8: Former Fire Training Facility is generally open and sparsely vegetated soil.

Human receptors can be exposed via dermal contact with and/or incidental ingestion of soil near the area. Under conditions when impacted surface soil may become dry, inhalation of impacted fugitive dust could cause exposure. Human receptors can also eat food (vegetables, fruits, deer, etc.) that was grown in or raised on PFAS-contaminated soil and wildlife that consumed contaminated plants. Current land use at the two potential AFFF AOCs would be expected to involve limited human health exposures. Future land use at the two potential AFFF AOCs is not expected to change; however, the possibility exists that human exposure may increase if the surface cover at AOC 9: Alpha 17 Runup Pad Fire Training Area is removed or replaced and the AOC 8: Former Fire Training Facility is developed.

The nearest residential areas are approximately 1.4 miles northeast of AOC 8: Former Fire Training Facility and 1.6 miles northeast of AOC 9: Alpha 17 Runup Pad Fire Training Area. There are no schools or daycare facilities within a 200-ft radius of AOC 8: Former Fire Training Facility or AOC 9: Alpha 17 Runup Pad Fire Training Area; the nearest school is approximately 1.8 and 2.1 miles north and northeast of each potential AFFF AOC, respectively. Based on the distance to human receptors and the land use around the potential AFFF AOCs it is unlikely that human receptors would be impacted via the soil pathway.

Ecological receptors may be exposed to contaminated media via the consumption of plants, invertebrates, and small mammals that accumulated PFAS in their tissues. Sensitive environments (riparian areas) are mapped within 200 feet of both potential AFFF AOCs thus there is the potentially complete pathway for ecological receptors to be exposed to contaminated site media via the soil pathway.

In terms of air pathways, neutral PFAS such as fluorotelomer alcohols (FTOHs), perfluorooctane sulfonamide (FOSA), and perfluorooctane sulfonamido ethanol (FOSE) are more volatile than negatively charged PFAS. Neutral PFAS have been found in the vapor phase in indoor environments, have been reported in high concentrations in AFFF, and vapor intrusion of these PFAS may occur from AFFF-contaminated groundwater (ITRC, 2023).

4.0 NON-FIRE TRAINING AREAS

4.1 Zone 1 – Description, Operational History, and Waste Characteristics

4.1.1 AOC 10: Original Fire Station (Pre-1964)

The Original Fire Station is located in the northwest corner of TUS, just north of AOC 1: TAA Hangars (**Figure 2**). A former complex of four buildings, D-33-5, D-111, D-101-9/10, and D-31 were located in this area. Buildings D-101-9/10 and D-111 were built in the early 1940s and used by TAA from 1948 to 1964 to support the municipal airport activities. The buildings housed flight line activities, administrative offices, and an aircraft fueling facility. Building D-33-5 was built in the early 1950s and was primarily used as a fire station by former tenant Grand Central Aircraft (GCA) during their tenancy between 1950 and 1954. Small amounts of gasoline and waste hydrocarbon products were used or stored at the station. Subsequent tenants in the area include Douglas Aircraft Company (1954-1960), Hughes Tool Company (1960-1966), and the United States Air Force (1966-1969). The buildings were used by Federal Express during the early 1990s for air freight loading and minor aircraft maintenance but were subsequently demolished. The use of the Original Fire Station is interpreted to predate the manufacture of AFFF; however, there is the possibility that the use of the Original Fire Station overlapped with the initial use of AFFF in the 1960s. No interviewees had direct knowledge of this AOC over the reported operational period.

4.1.2 AOC 11: Former Fire Station (1965 to 1978)

The Former Fire Station was located northwest of the terminal building from 1965 to 1978 (**Figure 2**). The location of this building is indicated as a New Fire & Rescue Equipment Building Site on the 1963 Airport Improvement Program Plans (**Appendix C**). Building B-232 (shared with terminal building) operated as a Fire Station from 1965 to 1978 (DBSA, 1993). The building was demolished sometime after 1978 (Tucker, 2023, **Appendix B**, Interviews and Site Visit Notes). The presence of AFFF is assumed based on the dates of occupation. No interviewees had direct knowledge of this AOC over the reported operational period.

4.1.3 AOC 12: US Forest Service (D-261)

Building D-261, built in 1973 and located north of AOC 1: TAA Hangars (**Figure 2**), has been occupied from the start by the United States Forest Service (USFS), who operated it as a slurry base/staging area for firefighting operations. Fire retardant chemicals were stored here. The USFS is known to use long term fire retardants which are typically the red liquids observed being dropped from aircraft. These products contain 85% water, 10% salts found in agricultural fertilizers (e.g., ammonium phosphate fertilizer), and 5% minor ingredients (colorant, corrosion inhibitors, thickener [natural gum and clay], stabilizers, and bactericides (United States Department of Agriculture [USDA], 2011). The dry products are mixed with water to aid in accuracy while dropping (Auxilio, 2020). The USDA fire retardant specification lists PFAS as an unacceptable ingredient (USDA, 2021a). The USFS may also use Class A foam fire suppressants to combat forest fires. These products are aerated to produce foam, but do not contain PFAS. Water enhancers, commonly referred to as gels, are also used but do not contain PFAS (Auxilio, 2020; USDA, 2021b). No evidence for Class B AFFF was found during the literature search for this building; however, helicopters are visible in aerial photos from 2005 and earlier. Class B AFFF fire extinguishers may have been present as part of crash rescue equipment for helicopter landing sites (NWCG, 2023). Based on historical aerial photos, the use of Building D-261 appears to have ended circa January 2010 (PimaMaps, 2023). No interviewees had direct knowledge of this AOC over the reported operational period.

4.1.4 AOC 13: TAA Annual Nozzle Testing Area

Tests of vehicle spray patterns using AFFF previously occurred at the intersection of Taxiway Alpha and Taxiway Delta (**Figure 2**). Testing was conducted annually with AFFF, as required by FAA FAR Part 139 regulations, until 2019 (Tucker, 2023, **Appendix B**, Interviews and Site Visit Notes). The current TAA Fire Chief, Tom Tucker, has worked at TAA since 2000 and has direct knowledge of firefighting operations during that period. Historically, this functionality testing required the discharge of AFFF from firefighting vehicles in order to measure the effectiveness of foam output. Recent FAA changes now allow for the use of closed-loop foam proportioning testing systems, which eliminate the need to discharge AFFF to the environment (NASEM, 2023; FAA, 2021). TAA began using the closed loop system for testing in November 2019.

4.1.5 AOC 14: Air National Guard Current Nozzle Testing Area

As reported in the Morris ANG Base PA, this area is located on TAA property but is used by the AANG for fire equipment testing (BB&E, 2016) (**Figure 2**). The common practice was to wash away AFFF with water into the storm drains. Testing was conducted quarterly with AFFF until 2015 when the tests were switched to water only. Runoff from this area flows to Airport Wash through Outfall W01 on the Morris ANG Base property. This location was not investigated during the Morris ANG Base Site Inspection due to its off-base location.

During preparation of this PA, the AANG has indicated that this area is included in the Morris Air National Guard Base Remedial Investigation which is currently ongoing. AANG also indicated that they are working with TAA to acquire the property associated with this AFFF AOC (Golden, 2023, **Appendix B**, Interviews and Site Visit Notes).

4.1.6 AOC 15: Ascent Aviation Hangar 2

The Ascent Aviation Hangar 2 is located on land leased by Ascent Aviation (**Figure 2**). The Ascent Aviation employee who was present during the site visit, William Johns, Site Manager, has worked at the facility since 1995 and has direct knowledge of the AOC since that time. The hangar is equipped with four RSDP-30 reeled stationary diaphragm proportioners, which are foam proportioning units equipped with an AFFF concentrate storage tank, discharge hose, and foam nozzle connected to a water source. Each unit includes a 30-gallon AFFF concentrate storage tank. The tanks are inspected and serviced annually by Shambaugh & Son, L.P. (Johns, 2023, **Appendix B**, Interviews and Site Visit Notes).

Ascent Aviation personnel, William Johns, Site Manager, recalls that before 2010, the AFFF in the tanks was drained and replaced. It is unknown what brand or type of AFFF concentrate was used. Western States (previous fire extinguisher contractor) took the drained AFFF and extra containers off-site (Johns, 2023, **Appendix B**, Interviews and Site Visit Notes).

One accidental release of the AFFF concentrate occurred in the southwest portion of the hangar in approximately 2010 or 2011. An employee intended to fill a bucket with water but accidentally released AFFF concentrate. The release was likely hosed out through the front door of the hangar (Johns, 2023, **Appendix B**, Interviews and Site Visit Notes).

There is a closed sump in the center of the hangar. When material accumulates in the sump, the material is pumped into totes, tested, and shipped off-site accordingly. There is no known release of AFFF into the sump (Johns, 2023, **Appendix B**, Interviews and Site Visit Notes).

4.1.7 AOC 16: Ascent Aviation Fire Emergency Response

AFFF was used during emergency response for a fire north of Ascent Aviation Hangar 1, located on land leased by Ascent Aviation (**Figure 2**). A plane was accidentally backed into an overhead live electrical line causing a fire (Johns, 2023, Tucker, 2023 [note: this incident is referred to as “At Ascent on west ramp...” in interview records]; **Appendix B**, Interviews and Site Visit Notes). The current TAA Fire Chief, Tom Tucker, has worked at TAA since 2000, and the Ascent Aviation Site Manager, William Johns, has worked at the facility since 1995. Both have

direct knowledge of this event. Site personnel could not recall the exact year this occurred but indicated it was between 2003 and 2010. A newspaper article in the Arizona Daily Star indicates a fire at this location occurred on July 16, 2010. The newspaper article indicates that Tucson Fire, AANG, and TAA fire crews handled the incident. TAA and Ascent Aviation personnel recall that AFFF was used; however, the quantity of or type of AFFF used during the response is unknown. The area is a concrete pad with no storm drains.

4.2 Zone 1 – Migration Pathways and Hazard Assessment

4.2.1 Groundwater Pathway

A general overview of the TUS geologic and hydrogeological settings is provided in **Sections 2.1** and **2.2**. A summary of PFAS groundwater sampling is provided in **Section 2.2.5**. The general groundwater flow direction at the AOC 10: Original Fire Station, AOC 11: Former Fire Station, AOC 12: US Forest Service (D-261), and AOC 13: TAA Annual Nozzle Testing Area is to the northwest.

There is a potentially complete exposure pathway via groundwater. Some of the wells within 4.0 miles are located hydraulically downgradient of the Zone 1 potential AFFF AOCs.

4.2.2 Surface Water Pathway

The TUS hydrologic setting is described in **Section 2.3**. When sufficient water is present, surface water runoff from the potential AFFF AOCs is collected via storm drains and catch basins, which using a network of underground pipes and will convey the water to a stormwater outwash. The topography in the area of the potential AFFF AOCs slopes gently to the northwest. Stormwater infrastructure will directly capture overland flow towards stormwater outfalls #44, #45, #46 and #47 located north of AOC 1: TAA Hangars. Water from these outfalls discharges into the Valencia and El Vado Washes (**Appendix D**). The AOC 11: Former Fire Station is located in the terminal area and stormwater will drain towards outfall #22 which discharges into Airport Wash.

TUS is located in a dry subtropical (desert subtype) climate. In the area of the potential AFFF AOCs, there are no established wetlands or ecosystems likely to support the establishment of wetlands. Potential ecological receptors include the aquatic community (fish, aquatic invertebrates, aquatic plants) in direct contact with surface water and benthic invertebrates in direct contact with sediment. Birds and mammals may also ingest contaminated water or prey that have bioaccumulated PFAS from exposure to surface water.

4.2.3 Soil and Air Pathways

Except for portions of the AOC 13: TAA Annual Nozzle Testing Area, the land surfaces at the potential AFFF AOCs are mostly paved or developed. Portions of AOC 13: TAA Annual Nozzle Testing Area are open and sparsely vegetated space. There is the potential that AFFF contaminated water infiltrated into the soil and into cracks in the surface cover and impacted the soil beneath.

Human receptors can be exposed via dermal contact with and/or incidental ingestion of soil near the area. Under conditions when impacted surface soil may become dry, inhalation of impacted fugitive dust could cause exposure. Human receptors can also eat food (vegetables, fruits, deer, etc.) that was grown in or raised on PFAS-contaminated soil and wildlife that consumed contaminated plants. Based on current use, human exposures at the potential AFFF AOCs are expected to be minimal as the areas are developed and covered by concrete or asphalt. Future use is expected to be the same.

The nearest residential area is approximately 0.2 miles west of AOC 16: Ascent Aviation Fire Emergency Response across the South Nogales Highway. The nearest residential area to AOC 11: Former Fire Station is approximately 1 mile north of the potential AFFF AOC. There are no schools or daycare facilities within a 200-ft radius of any of the potential AFFF AOCs. The nearest school to the Ascent Aviation potential AFFF AOCs (AOCs 15 and 16) is approximately 0.5 miles to the west. The nearest school to the AOC 11: Former Fire Station is

approximately 1 mile north of the potential AFFF AOC. Based on the distance to human receptors and the land use around the potential AFFF AOCs it is unlikely that human receptors would be impacted via the soil pathway.

Ecological receptors may be exposed to contaminated media via the consumption of plants, invertebrates, and small mammals that accumulated PFAS in their tissues; however, no terrestrial sensitive environments exist within 200 feet of the areas. Because the area does not present a valuable or attractive habitat to ecological receptors and there are no sensitive environments within 200 feet, there is a low potential for exposure to contaminated media by ecological receptors via the soil pathway.

In terms of air pathways, neutral PFAS such as fluorotelomer alcohols (FTOHs), perfluorooctane sulfonamide (FOSA), and perfluorooctane sulfonamido ethanol (FOSE) are more volatile than negatively charged PFAS. Neutral PFAS have been found in the vapor phase in indoor environments, have been reported in high concentrations in AFFF, and vapor intrusion of these PFAS may occur from AFFF-contaminated groundwater (ITRC, 2023).

4.3 Zone 2 – Description, Operational History, and Waste Characteristics

4.3.1 AOC 17: Bombardier Building B

Bombardier Building B is located on land leased by Bombardier (**Figure 3**). The Wolverine Fire Protection Company employee who was present during the site visit, Kevin Mirlocca, Fire Protection Specialist, has worked at the facility since 2015 and has direct knowledge of the AOC since that time. The Building B hangar is equipped with four AFFF hose stands. Each hose stand includes AFFF concentrate stored in a 55-gallon plastic drum which is connected to a hose reel and a piped water source. The drums are located on the concrete floor of the hangar. During the PA site visit, site personnel did not recall any use of or spills of AFFF in this building (Mirlocca, 2023, **Appendix B**, Interviews and Site Visit Notes).

4.3.2 AOC 18: Bombardier Building D

Bombardier Building D is located on land leased by Bombardier (**Figure 3**). The Wolverine Fire Protection Company employee who was present during the site visit, Kevin Mirlocca, Fire Protection Specialist, has worked at the facility since 2015 and has direct knowledge of the AOC since that time. The Building D hangar is equipped with four AFFF hose stands. Each hose stand includes AFFF concentrate stored in a 55-gallon plastic drum which is connected to a hose reel and a piped water source. The drums are located on the concrete floor of the hangar. During the PA site visit, site personnel did not recall any use of or spills of AFFF in this building (Mirlocca, 2023, **Appendix B**, Interviews and Site Visit Notes).

4.3.3 AOC 19: Bombardier Building E

Bombardier Building E is located on land leased by Bombardier (**Figure 3**). The Wolverine Fire Protection Company employee who was present during the site visit, Kevin Mirlocca, Fire Protection Specialist, has worked at the facility since 2015 and has direct knowledge of the AOC since that time. The Building E hangar is equipped with ten AFFF hose stands. Each hose stand includes AFFF concentrate stored in a 55-gallon plastic or steel drum which is connected to a hose reel and a piped water source. The drums are located on the concrete floor of the hangar. During the PA site visit, site personnel indicated that approximately 3 years ago a leak of AFFF concentrate occurred from a rusted steel drum located in the northwest corner of the hangar. The leaking steel drum was subsequently replaced with a plastic drum (Mirlocca, 2023, **Appendix B**, Interviews and Site Visit Notes).

4.3.4 AOC 20: Bombardier Building F

Bombardier Building F is located on TAA land leased by Bombardier (**Figure 3**). The Wolverine Fire Protection Company employee who was present during the site visit, Kevin Mirlocca, Fire Protection Specialist, has worked at the facility since 2015 and has direct knowledge of the AOC since that time. The Building F hangar is equipped

with an overhead AFFF fire suppression system (FSS) and one AFFF hose stand. There is one 2,000-gallon AFFF concentrate vertical steel storage tank located inside the northwest corner of the hangar. The tank is located on the concrete floor. During the PA site visit, site personnel did not recall any use of or spills of AFFF concentrate in this building (Mirlocca, 2023, **Appendix B**, Interviews and Site Visit Notes).

Kevin Mirlocca, Fire Protection Specialist, reported there is no historical knowledge or documentation related to FSS testing, usage, or accidental releases (Mirlocca, 2023, **Appendix B**, Interviews and Site Visit Notes). There is a drain and recovery pit in the center of the hangar, which is then conveyed via underground piping to a recovery tank located south of Building F. The recovery tank is connected to drains in Building F and Building Y.

4.3.5 AOC 21: Bombardier Building H

Bombardier Building H is located on land leased by Bombardier (**Figure 3**). The Wolverine Fire Protection Company employee who was present during the site visit, Kevin Mirlocca, Fire Protection Specialist, has worked at the facility since 2015 and has direct knowledge of the AOC since that time. The Building H hangar is equipped with four AFFF hose stands. Each hose stand includes AFFF concentrate stored in a 55-gallon plastic drum which is connected to a hose reel and a piped water source. The drums are located on the concrete floor of the hangar. During the PA site visit, Kevin Mirlocca, Fire Protection Specialist, did not recall any use of or spills of AFFF in this building; however, some red staining is present on the concrete in the area of the plastic drums (Mirlocca, 2023, **Appendix B**, Interviews and Site Visit Notes; **Appendix A**, Photo Documentation).

4.3.6 AOC 22: Bombardier Building J

Bombardier Building J is located on land leased by Bombardier (**Figure 3**). The Wolverine Fire Protection Company employee who was present during the site visit, Kevin Mirlocca, Fire Protection Specialist, has worked at the facility since 2015 and has direct knowledge of the AOC since that time. The Building J hangar is equipped with four AFFF hose stands. Each hose stand includes AFFF concentrate stored in a 55-gallon drum which is connected to a hose reel and a piped water source. The drums are located on the concrete floor of the hangar. During the PA site visit, Kevin Mirlocca, Fire Protection Specialist, did not recall any use of or spills of AFFF in this building (Mirlocca, 2023, **Appendix B**, Interviews and Site Visit Notes).

4.3.7 AOC 23: Bombardier Building K

Bombardier Building K is located on land leased by Bombardier (**Figure 3**). The Wolverine Fire Protection Company employee who was present during the site visit, Kevin Mirlocca, Fire Protection Specialist, has worked at the facility since 2015 and has direct knowledge of the AOC since that time. The Building K hangar is equipped with four AFFF hose stands. Each hose stand includes AFFF concentrate stored in a 55-gallon steel drum which is connected to a hose reel and a piped water source. The drums are located on the concrete floor of the hangar. During the PA site visit, Kevin Mirlocca, Fire Protection Specialist, did not recall any use of or spills of AFFF in this building (Mirlocca, 2023, **Appendix B**, Interviews and Site Visit Notes).

4.3.8 AOC 24: Bombardier Building S

Bombardier Building S is located on land leased by Bombardier (**Figure 3**). The Wolverine Fire Protection Company employee who was present during the site visit, Kevin Mirlocca, Fire Protection Specialist, has worked at the facility since 2015 and has direct knowledge of the AOC since that time. The Building S hangar is equipped with an overhead AFFF FSS. There is one 2,400-gallon AFFF concentrate horizontal steel storage tank in the mechanical room on the south side of the hangar. The tanks are located on the concrete floor of the mechanical room. During the PA site visit, site personnel disclosed that a spill of approximately 4 gallons of AFFF concentrate occurred from the dispensing piping above the tank during the summer of 2023 (Mirlocca, 2023, **Appendix B**, Interviews and Site Visit Notes). The spill was collected in buckets and returned into a 55-gallon drum at the site.

Absorbent mats were used for the residual spill and disposed of by US Ecology, Bombardier's environmental contractor.

The hangar FSS system is equipped with 6 risers connected to the AFFF tanks. Kevin Mirlocca, Fire Protection Specialist, reported there is no historical knowledge or documentation related to FSS testing, usage, or accidental releases (Mirlocca, 2023, **Appendix B**, Interviews and Site Visit Notes). Floor drains at the front of the hangar near the hangar doors would have collected any releases of AFFF.

4.3.9 AOC 25: Bombardier Building X

Bombardier Building X is located on land leased by Bombardier (**Figure 3**). The Wolverine Fire Protection Company employee who was present during the site visit, Kevin Mirlocca, Fire Protection Specialist, has worked at the facility since 2015 and has direct knowledge of the AOC since that time. The Building X hangar is equipped with an overhead AFFF FSS. There is one 2,400-gallon AFFF concentrate horizontal steel storage tank in the mechanical room on the north side of the hangar. The tanks are located on the concrete floor of the mechanical room. During the PA site visit, site personnel disclosed that a small spill of AFFF concentrate occurred from the ball valve on the piping adjacent to the tank (Mirlocca, 2023, **Appendix B**, Interviews and Site Visit Notes). Absorbent mats were used for the spill and disposed of by US Ecology. Red staining is present on the concrete around the floor drains (**Appendix A**, Photo Documentation).

Kevin Mirlocca, Fire Protection Specialist, reported that two accidental discharges of the FSS have occurred (Mirlocca, 2023, **Appendix B**, Interviews and Site Visit Notes). The first discharge occurred on October 16, 2015, and the second on June 29, 2016. Both times, the pull station in the northeast corner of the hangar was triggered by rainwater infiltration into the building from the flashing on top of the cinder block walls. During both incidents, full discharges of the FSS system occurred. The hangar is equipped with closed system collection drains which were pumped out both times and disposed of by US Ecology. During the first discharge, piping above the stock room inside the hangar burst, causing the stock room to also be filled with AFFF. The stock room was subsequently cleaned by an environmental contractor.

4.3.10 AOC 26: Bombardier Building Y

Bombardier Building Y is located on land leased by Bombardier (**Figure 3**). The Wolverine Fire Protection Company employee who was present during the site visit, Kevin Mirlocca, Fire Protection Specialist, has worked at the facility since 2015 and has direct knowledge of the AOC since that time. The Building Y hangar is equipped with an overhead AFFF FSS. There is one 2,400-gallon AFFF concentrate horizontal steel storage tank in the mechanical room on the east side of the hangar. The tank is located on the concrete floor. During the PA site visit, Kevin Mirlocca, Fire Protection Specialist, did not recall any use of or spills of AFFF concentrate in this building (Mirlocca, 2023, **Appendix B**, Interviews and Site Visit Notes).

Kevin Mirlocca, Fire Protection Specialist, reported there is no historical knowledge or documentation related to FSS testing, usage, or accidental releases (Mirlocca, 2023, **Appendix B**, Interviews and Site Visit Notes). There is a drain and recovery pit in the center of the hangar, which is then conveyed via underground piping to a recovery tank located south of Building F. The recovery tank is connected to drains in Building F and Building Y.

4.3.11 AOC 27: Bombardier Storage Conex

The Bombardier Storage Conex is located on land leased by Bombardier (**Figure 3**). The Wolverine Fire Protection Company employee who was present during the site visit, Kevin Mirlocca, Fire Protection Specialist, has worked at the facility since 2015 and has direct knowledge of the AOC since that time. The storage conex, located on the west side of Building H, is used for storing AFFF concentrate. During the time of the site visit, three 55-gallon plastic drums of Chemguard 3% AFFF concentrate (C6 formula; product ID C3B) were stored in the conex. The conex box includes a steel grate floor with a secondary containment system below.

4.3.12 AOC 28: Mitsubishi Heavy Industries Hangar

The MHI Hangar is located on land leased by MHI (**Figure 3**). The Wolverine Fire Protection Company employee who was present during the site visit, Kevin Mirlocca, Fire Protection Specialist, has worked at the facility since 2015 and has direct knowledge of the AOC since that time. MHI acquired this hangar from Bombardier, and MHI's lease was initiated on April 30, 2020. The hangar is equipped with an overhead AFFF FSS. There are two plastic 4,800-gallon AFFF concentrate storage tanks in the mechanical room on the northwest side of the hangar. At the time of the PA site visit, each tank contained approximately 4,200 gallons of AFFF. The tanks are located on the concrete floor of the mechanical room. During the PA site visit, site personnel disclosed that a spill of less than 1 gallon of AFFF occurred at the valve piping in the mechanical room approximately two years ago (Mirlocca, 2023, **Appendix B**, Interviews and Site Visit Notes).

The hangar FSS system is equipped with 13 risers connected to the AFFF concentrate tanks. Kevin Mirlocca, Fire Protection Specialist, reported there is no historical knowledge or documentation related to FSS testing, usage, or accidental releases (Mirlocca, 2023, **Appendix B**, Interviews and Site Visit Notes). Closed floor drains at the front of the hangar near the hangar doors which are approximately 18 inches wide by 4 feet deep would have collected any releases of AFFF, and the drains would have been pumped out.

4.4 Zone 2 – Migration Pathways and Hazard Assessment

4.4.1 Groundwater Pathway

A general overview of the TUS geologic and hydrogeological settings is provided in **Sections 2.1** and **2.2**. A summary of PFAS groundwater sampling is provided in **Section 2.2.5**. The general groundwater flow direction within Zone 2 is to the northwest and the depth to groundwater is approximately 80 to 100 feet bgs (Ayuda, 2018).

There is a potentially complete exposure pathway via groundwater. Some of the wells within 4.0 miles are located hydraulically downgradient of the Zone 2 potential AFFF AOCs.

4.4.2 Surface Water Pathway

The TUS hydrologic setting is described in **Section 2.3**. When sufficient water is present, surface water runoff from the Bombardier (AOCs 17–27) and MHI (AOC 28) leaseholds is collected via storm drains and catch basins, which use a network of above ground ditches and underground pipes to convey the water to a stormwater outfall. Generally, the Zone 2 topography slopes gently to the west. Box and pipe culverts convey overland flow in the area towards stormwater outwash #50 located approximately 500 to 3,500 feet west of the Bombardier hangars (AOCs 17–27) and approximately 3,500 feet northwest of the MHI Hangar (AOC 28). Overland flow in the vicinity will follow the local topography and flow into stormwater infrastructure associated with nearby roads. Outfall #50 and the nearby road infrastructure discharge into Santa Clara Wash (**Appendix D**).

TUS is located in a dry subtropical (desert subtype) climate. There are no established wetlands or ecosystems likely to support the establishment of wetlands. Potential ecological receptors include the aquatic community (fish, aquatic invertebrates, aquatic plants) in direct contact with surface water and benthic invertebrates in direct contact with sediment. Birds and mammals may also ingest contaminated water or prey that have bioaccumulated PFAS from exposure to surface water.

4.4.3 Soil and Air Pathways

The land surface at the Bombardier (AOCs 17–27) and MHI (AOC 28) potential AFFF AOCs is primarily concrete or pavement. There is the potential that AFFF contaminated water infiltrated into the soil and into cracks in the surface cover and impacted the soil beneath.

Human receptors can be exposed via dermal contact with and/or incidental ingestion of soil near the area. Under conditions when impacted surface soil may become dry, inhalation of impacted fugitive dust could cause exposure. Human receptors can also eat food (vegetables, fruits, deer, etc.) that was grown in or raised on PFAS-contaminated soil and wildlife that consumed contaminated plants. Based on current use, human exposures at the Bombardier and MHI potential AFFF AOCs are expected to be minimal as the areas are developed and covered by concrete or asphalt. Future use is expected to be the same.

The nearest residential area is located approximately 0.5 to 1.2 miles to the west across the South Nogales Highway from the Bombardier (AOCs 17–27) and MHI (AOC 28) leaseholders, respectively. There are no schools or daycare facilities within a 200-ft radius of the AOCs. The nearest school is approximately 0.5 miles west of the nearest Bombardier hangar. Based on the distance to human receptors and the land use around the potential AFFF AOCs it is unlikely that human receptors would be impacted via the soil pathway.

Ecological receptors may be exposed to contaminated media via the consumption of plants, invertebrates, and small mammals that accumulated PFAS in their tissues; however, no terrestrial sensitive environments exist within 200 feet of the areas. Because the area does not present a valuable or attractive habitat to ecological receptors and there are no sensitive environments within 200 feet, there is a low potential for exposure to contaminated media by ecological receptors via the soil pathway.

In terms of air pathways, neutral PFAS such as fluorotelomer alcohols (FTOHs), perfluorooctane sulfonamide (FOSA), and perfluorooctane sulfonamido ethanol (FOSE) are more volatile than negatively charged PFAS. Neutral PFAS have been found in the vapor phase in indoor environments, have been reported in high concentrations in AFFF, and vapor intrusion of these PFAS may occur from AFFF-contaminated groundwater (ITRC, 2023).

4.5 Zone 3 – Description, Operational History, and Waste Characteristics

4.5.1 AOC 29: Current TAA Fire Station (B-284)

The current TAA Fire Station is located in Building B-284 (**Figure 4**) and has been operational since 1978. The current TAA Fire Chief, Tom Tucker, has worked at TAA since 2000 and has direct knowledge of firefighting operations during that period. In the historical supporting figures in **Appendix C**, the current Fire Station is identified as the “CFR Fire Station.” The Fire Station (Building B-284) stores waste fuel and oil associated with equipment maintenance and repair, and the facility was equipped with a drain and sand trap to catch oil and wash water runoff which discharged to the city sewer system. Currently, an OWS is located northwest of the Fire Station and discharges to the sanitary sewer (**Appendix B**). Outside the bay doors, dark colored staining on the concrete was visible during the PA Site Visit (**Appendix A**, Photo Documentation).

The following vehicles are currently housed at the TAA Fire Station:

- One Rosenbauer 4x4 with a 200-gallon foam tank
- One Rosenbauer 6x6 with a 385-gallon foam tank
- One Oshkosh Striker 6x6 with a 420-gallon foam tank
- One Rosenbauer Airwolf with a 40-gallon foam tank

Since 2020, approximately ten to twelve vehicles have carried AFFF for the TAA Fire Department. Historical vehicles were sold or donated (Tucker, 2023, **Appendix B**, Interviews and Site Visit Notes).

AFFF concentrate is also stored in 5-gallon containers in a storage shed in the parking lot. At the time of the site visit, 12 containers of Chemguard 3% AFFF (C306-MS-C; C6 formula) were stored in the shed. The shed has a wooden floor. The AFFF concentrate containers are brought into the Fire Station where they are used to fill the vehicles as needed (Tucker, 2023, **Appendix B**, Interviews and Site Visit Notes). Previously, empty buckets were placed in nearby dumpsters for general solid waste disposal at an off-site landfill. Since 2019, there is a

designated AFFF waste storage located southeast of the Fire Station (**Figure 4**). The storage, which includes a cover and secondary containment, is used for storage of liquid waste (from closed system AFFF tests) and solid waste (such as used personal protective equipment and empty AFFF concentrate containers) (Delgadillo, 2023, **Appendix B**, Interviews and Site Visit Notes).

4.5.2 AOC 30: TAA Fire Station Nozzle Testing Area

Tests of vehicle spray patterns using AFFF previously occurred in front of the Fire Station (**Figure 4**). The current TAA Fire Chief, Tom Tucker, has worked at TAA since 2000 and has direct knowledge of firefighting operations during that period. Testing was conducted quarterly with AFFF until 2019. Nozzle tests reportedly occurred up to 200 feet away from the Fire Station (Tucker, 2023, **Appendix B**, Interviews and Site Visit Notes). Historically, and per FAA FAR Part 139 requirements, this functionality testing required the discharge of AFFF from firefighting vehicles in order to measure the effectiveness of foam output. Recent FAA changes now allow for the use of closed-loop foam proportioning testing systems, which eliminate the need to discharge AFFF to the environment (NASEM, 2023; FAA, 2021). TAA began using the closed loop system for testing in November 2019. Dark colored staining was observed on the concrete during the PA site visit (**Appendix A**, Photo Documentation).

4.5.3 AOC 31: Twin Engine (Piper PA30) Emergency Response

On November 10, 2010, about 1657 mountain standard time, a Piper PA30, N628R, collided with a light post and a building during taxi after landing at TUS. The pilot landed on Runway 12 (formerly 11L). He could not slow the airplane down by Taxiway A11, so he continued to Taxiway A13. He was unable to stop the airplane prior to crossing Taxiway A or execute a left turn. The airplane continued forward until it struck the Fire Department warning light post with the right-wing tip tank (**Figure 4**). Fuel began escaping as the airplane continued forward into the Fire Station's plate glass window. No fire was reported (National Transportation Safety Board [NTSB], 2010). A photo of this incident from the Tucson Airport Authority Fire Department (2013) shows what looks to be AFFF surrounding the airplane (**Appendix C**). In a photo from the PA site visit, dark staining is visible on the concrete near the emergency response area (**Appendix A**, Photo Documentation).

4.5.4 AOC 32: Twin Engine (Beech BE300) Emergency Response

On January 23, 2017, about 1233 mountain standard time, a Beech 300 airplane, N385KA, was destroyed when it impacted terrain shortly after takeoff from Runway 12 (formerly Runway 11L) at TUS. The accident site was located on the ramp adjacent to the south terminal (**Figure 4**). The initial impact point was about 4,000 feet from the departure end of Runway 12 (formerly Runway 11L). A debris path led north from the impact point about 650 feet across the ramp to the main wreckage, which was resting against an 8-ft-tall concrete wall. A postimpact fire damaged the wreckage (NTSB, 2017). Discharge of AFFF was confirmed during interviews (Tucker, 2023, **Appendix B**, Interviews and Site Visit Notes). The current TAA Fire Chief, Tom Tucker, has worked at TAA since 2000 and has direct knowledge of the incident. News photographs of the incident shows what appears to be foam surrounding the crash site (**Appendix C**).

4.5.5 AOC 33: TAA Maintenance Yard Emergency Response

The TAA Fire Department used AFFF during an emergency response for a fire at the Maintenance Yard (**Figure 4**) (Tucker, 2023, **Appendix B**, Interviews and Site Visit Notes). The current TAA Fire Chief, Tom Tucker (working at TAA since 2000), the current TAA Supervisor of Fleet Management (Alan Moseley, working at TAA since 2017), and the former TAA Environmental Specialist (Eder Delgadillo, working at TAA from 2019 through September 2021) have direct knowledge of the incident. On January 31, 2019, a crack sealing machine spontaneously combusted while stored under a carport ramada in the Maintenance Yard (Moseley, 2023, **Appendix B**, Interviews and Site Visit Notes). The Rosenbauer 4x4 with a 200-gallon foam tank responded to the emergency, and AFFF was deployed to quench the fire. No estimate of the quantity of AFFF used was provided. There are no stormwater drains in the area, and photographs taken following the incident show AFFF on the pavement and

gravel areas surrounding the ramada. From February 1 to 9, 2019, a remediation project was performed to remove the impacted soil both to the southwest and northeast of the ramada. Soil was removed based on visual impacts up to approximately 2 to 5 feet below original ground surface. No confirmation testing was performed. The soil was temporarily staged on plastic, and then disposed of by US Ecology. The area surrounding the ramadas was backfilled with clean fill (Delgadillo, 2023, **Appendix B**, Interviews and Site Visit Notes).

4.5.6 AOC 34: TAA Vehicle Maintenance Bays

Maintenance of the TAA Fire Department's AFFF-containing vehicles occurs at the TAA Maintenance Facility in the maintenance bays (**Figure 4**). Interviewees and site visit attendees included the current TAA Fire Chief, Tom Tucker (working at TAA since 2000), the current TAA Supervisor of Fleet Management (Alan Moseley, working at TAA since 2017), and the former TAA Environmental Specialist (Eder Delgadillo, working at TAA from 2019 through September 2021) provided direct knowledge of the AOC per their service periods. AFFF has been poured from buckets into firefighting vehicles at this location. Previously, empty buckets were placed in nearby dumpsters for general solid waste disposal at an off-site landfill. Since 2019, there is a designated AFFF waste storage located southeast of the Fire Station. From 2019 onward, best management practices have been employed to ensure proper management of AFFF concentrate. Prior to 2019, there is a possibility of AFFF concentrate releases resulting from maintenance activities (Delgadillo, 2023, **Appendix B**, Interviews and Site Visit Notes).

4.5.7 AOC 35: TAA Warehouse

AFFF concentrate for use by the TAA Fire Department is stored in the TAA Warehouse (**Figure 4**). At the time of the site visit, there were seven plastic pallets holding 5-gallon containers of Chemguard 3% AFFF (C306-MS-C; C6 formula). The seven pallets held a total of 271 containers for a total of 1,355 gallons of AFFF concentrate. The pallets were stored on metal shelving or on the concrete floor.

4.5.8 AOC 36: Millings Pile

The millings pile is located to the southeast of the current Fire Station (**Figure 4**). Millings from miscellaneous runway and airport improvement projects are stored in the pile on native ground. If the millings were from runway, concrete, or paved areas where AFFF was previously discharged, there is potential that the millings pile could contain AFFF.

4.5.9 AOC 37: Wash Area

Washdown operations were conducted at the wash area located south of the terminal at the edge of the terminal apron (**Figure 4**). No interviewees had direct knowledge of this AOC over the reported operational period. The wash operation was active in the 1980s and was used intermittently to wash airplanes, fire trucks, and airport vehicles. Only detergents have been used in this area, including a caustic cleaner known as "Leeder Ardrex 1408," which contains less than 10% Stoddard solvent, approximately 5% 2-butoxy ethanol, and less than 5% monoethanolamine, and is diluted with 10 parts of water for use (DBSA, 1993). The potential exists that AFFF contaminated equipment (e.g., nozzles and hoses) were washed in this area. The confirmed use of this area for washing AFFF equipment was not determined during interviews, the site visit, or historical documents.

4.5.10 AOC 38: Raytheon Building 845

Raytheon Building 845 is located on land leased by Raytheon (**Figure 4**). Mike Crosby, Facilities Director, was present during the site visit; however, it was not noted how long he has worked at the facility or what period of time he has direct knowledge of the AOC. The hangar is equipped with an overhead AFFF FSS. There is one steel 3,000-gallon AFFF concentrate storage tank in the pump house room on the south-southwest side of the hangar. Mike Crosby, Facilities Director, indicated that the main portion of the hangar was built in 2011 (Crosby, 2023,

Appendix B, Interviews and Site Visit Notes). The AFFF concentrate tank has a tag that is marked year 2000. The tank currently contains Ansulite 3%; however, there is a scratch out on the tank which indicates that 6% may have previously been used. The floor of the pump room is concrete. Mike Crosby, Facilities Director, reported that there are no known spills or leaks from the tank in the pump house.

The hangar consists of four bays. Bays A through C were part of the original building and do not have any drainage systems. Bay D was added in 2018 and includes a drainage system to an OWS with a catch tank. One initial FSS test in Bay D was released to that system. Mike Crosby, Facilities Director, indicated that prior to 2019, annual FSS tests were performed in Bay C. The foam would be allowed to air dry on the tarmac to the northeast of the hangar. Mike Crosby, Facilities Director, indicated that foam did not reach the drainage system to the northeast of the hangar (Crosby, 2023, **Appendix B**, Interviews and Site Visit Notes).

4.6. Zone 3 – Migration Pathways and Hazard Assessment

4.6.1 Groundwater Pathway

A general overview of the TUS geologic and hydrogeological settings is provided in **Sections 2.1** and **2.2**. A summary of PFAS groundwater sampling is provided in **Section 2.2.5**. The general groundwater flow direction at Zone 3 is to the northwest and the depth to groundwater is approximately 80 to 100 feet bgs (DBSA, 1993; Ayuda, 2018).

There is a potentially complete exposure pathway via groundwater. Some of the wells within 4.0 miles are located hydraulically downgradient of the Zone 3 potential AFFF AOCs.

4.6.2 Surface Water Pathway

The TUS hydrologic setting is described in **Section 2.3**. When sufficient water is present, surface water runoff will follow the topography at the potential AFFF AOCs and generally infiltrate the ground surface. Surface water runoff for the majority of Zone 3 non-fire training area potential AFFF AOCs likely drains via the topography and above ground drainage ditches directly to the Airport Wash (**Appendix D**). The exception is that stormwater drainage around AOC 38: Raytheon Building 845 is conveyed to the west of the facility. Stormwater runoff from the Zone 3 potential AFFF AOCs may infiltrate the bare ground surface or runoff via airport above ground drainage ditches and allowed to evaporate.

TUS is located in a dry subtropical (desert subtype) climate. There are no established wetlands in proximity to the potential AFFF AOCs; however, riparian areas are mapped within 200 feet of both potential AFFF AOCs and may exposure ecological receptors to contaminated site media during wet periods when water is present in the nearby washes. Potential ecological receptors include the aquatic community (fish, aquatic invertebrates, aquatic plants) in direct contact with surface water and benthic invertebrates in direct contact with sediment. Birds and mammals may also ingest contaminated water or prey that have bioaccumulated PFAS from exposure to surface water.

4.6.3 Soil and Air Pathways

The land surface at the Zone 3 non-fire training area potential AFFF AOCs varies. The AOC 30: TAA Fire Station Nozzle Testing Area and AOC 33: TAA Maintenance Yard Emergency Response Site are paved with native soil on the edges of the potential AFFF AOC. The AOC 36: Millings Pile is located on native ground and surrounded by sparsely vegetated soil. All the other potential AFFF AOCs are primarily concrete or pavement. There is the potential that AFFF contaminated water infiltrated into the soil and into cracks in the surface cover and impacted the soil beneath.

Human receptors can be exposed via dermal contact with and/or incidental ingestion of soil near the area. Under conditions when impacted surface soil may become dry, inhalation of impacted fugitive dust could cause

exposure. Human receptors can also eat food (vegetables, fruits, deer, etc.) that was grown in or raised on PFAS-contaminated soil and wildlife that consumed contaminated plants. Current land use at the potential AFFF AOCs would be expected to involve limited human health exposures. Future land use is not expected to change; however, the possibility exists that human exposure may increase if the impacted paved surface covers are removed or replaced or the native ground is developed.

The nearest residential areas are approximately 1.5 miles northeast of the northern Zone 3 non-fire training area potential AFFF AOCs, approximately 1.4 miles northeast of AOC 36: Millings Pile, and approximately 1.5 miles southwest of AOC 38: Raytheon Building 845. There are no schools or daycare facilities within a 200-ft radius of the Zone 3 non-fire training area potential AFFF AOCs; the nearest school is approximately 1.7 miles north of eastern potential AFFF AOCs and approximately 1.5 miles northwest of AOC 38: Raytheon Building 845. Based on the distance to human receptors and the land use around the potential AFFF AOCs it is unlikely that human receptors would be impacted via the soil pathway.

Ecological receptors in the vicinity of AOC 36: Millings Pile potential AFFF AOC may be exposed to contaminated media via the consumption of plants, invertebrates, and small mammals that accumulated PFAS in their tissues. Sensitive environments (riparian areas) are mapped within 200 feet of AOC 36: Millings Pile potential AFFF AOC thus there is the potentially complete pathway for ecological receptors to be exposed to contaminated site media via the soil pathway. The other AOCs in Zone 3 do not have sensitive environments mapped within 200 feet thus there is a low potential for exposure to contaminated media by ecological receptors via the soil pathway.

In terms of air pathways, neutral PFAS such as fluorotelomer alcohols (FTOHs), perfluorooctane sulfonamide (FOSA), and perfluorooctane sulfonamido ethanol (FOSE) are more volatile than negatively charged PFAS. Neutral PFAS have been found in the vapor phase in indoor environments, have been reported in high concentrations in AFFF, and vapor intrusion of these PFAS may occur from AFFF-contaminated groundwater (ITRC, 2023).

5.0 SUMMARY AND CONCLUSIONS

Thirty-eight (38) potential AFFF AOCs were identified at TUS during this PA as summarized in **Table 3**. Of these 38 sites, 35 are recommended for further investigation by TAA and one (1) is undergoing further investigation as part of the AANG Remedial Investigation.

Further investigation is recommended to monitor and characterize possible soil, groundwater, surface water, and sediment contamination. At AFFF AOCs where underground piping and OWSs are present, the structural integrity of the underground piping and OWS should be verified.

Table 3 summarizes the recommendations and rationale for each potential AFFF AOC identified at TUS.

5.1 Limitations and Potential Data Gaps

Limitations associated with the results of this PA are a function of the uncertainty associated with information sources. Limitations of the report include:

- **Scope:** The scope of this PA was limited to potential releases of PFAS to the environment related to the use and storage of AFFF on TUS. The scope did not include responses by the TAA Fire Department to off-airport mutual aid requests. The scope did not include an assessment of non-AFFF PFAS releases.
- **Record Research:** The research conducted for this PA was limited to information, including reports, database records, and other files available through TAA, on the internet, and/or provided by interviewees. Additionally, TAA fire department logbooks from 2001 to present were reviewed. Earlier logbooks could not be located, likely due to record retention practices.
- **Database Searches:** The accuracy and completeness of database searches, of both independent and State-operated databases, were limitations of this PA Report. Database resources were not always up to date with accurate information. Consistency of information between databases was conflicting.
- **State well database queries** sometimes lacked descriptive properties of well completions and did not always define a well's intended use (i.e., drinking water, irrigation, agricultural, monitoring, etc.) Furthermore, not all private wells were identified in databases.
- **Interviews:** Much of the information presented in this report is based on personal communication and represents the viewpoints of individuals interviewed. These viewpoints are limited to the time span and memories of a given individual, gaps in time or memory could result in information on AFFF storage and usage not being presented in this report. Personnel interviewed at TUS may not have been employed there throughout the period in which AFFF was used at the site or present on TUS during specific potential release events. Additionally, PFAS are emerging contaminants, and because of this recent awareness, TUS does not have the same detailed records regarding the storage, handling, and release of AFFF as for other substances used at the airport.

Table 3
Summary and Recommendations for Potential Aqueous Film-Forming Foam Areas of Concern

Grouping	Airport Zone	Location	Potential AFFF AOC	Rationale	Recommendation
Fire Training Areas	Zone 1	Figure 2	AOC 1: TAA Hangars - Former Fire Training Area	Former fire training area with use of AFFF reported by TUS personnel.	Proceed to Site Inspection
			AOC 2: Fire Drill Training Area A-1	Former fire training area used in the 1950s, when it is presumed that AFFF was not yet on TUS.	No further remedial action planned
	Zone 2	Figure 3	AOC 3: Abandoned TAA Fire Drill Area	Former fire training area with use of AFFF reported by TUS personnel.	Proceed to Site Inspection
			AOC 4: Fire Drill Training Area D-3	Former fire training area from the mid to late 1960s until 1973. No known use of AFFF, but AFFF use is assumed based on the dates of fire training.	Proceed to Site Inspection
			AOC 5: Fire Drill Training Area D-4	Former fire training area used in the late 1950s and 1960s, when it is presumed that AFFF was not yet on TUS; however, there is the possibility of overlap with early use of AFFF in the 1960s.	Proceed to Site Inspection
			AOC 6: Fire Drill Training Area D-5	Former fire training area used in the early 1950s, when it is presumed that AFFF was not yet on TUS.	No further remedial action planned
			AOC 7: Fire Drill Training Area D-6	Former fire training reported within the former landfill. Date of fire training in this area is not reported; however, given the dates that the landfill was open, use of AFFF in the area is possible.	Proceed to Site Inspection
	Zone 3	Figure 4	AOC 8: Former Fire Training Facility	Former fire training area used from mid 1960s to 1992 with use of AFFF reported by TAA personnel.	Proceed to Site Inspection
			AOC 9: Alpha 17 Runup Pad Fire Training Area	Fire training area with use of AFFF reported by TAA personnel.	Proceed to Site Inspection
Non-Fire Training Areas	Zone 1	Figure 2	AOC 10: Original Fire Station (Pre-1964)	Former fire station for TUS used from 1948 to 1964, when it is presumed that AFFF was not yet at TUS; however, there is the possibility of overlap with early use of AFFF in the 1960s.	Proceed to Site Inspection
			AOC 11: Former Fire Station (1965 to 1978)	Former fire station for TUS used from 1965 to 1978. No known use of AFFF, but AFFF use is assumed based on the dates of operation.	Proceed to Site Inspection
			AOC 12: U.S. Forest Service (D-261)	Building used to store materials for fire-fighting operations, but there is no evidence for use of Class B AFFF.	Proceed to Site Inspection
			AOC 13: TAA Annual Nozzle Testing Area	Former equipment testing area with use of AFFF reported by TAA personnel.	Proceed to Site Inspection
			AOC 14: Air National Guard Current Nozzle Testing Area	Former equipment testing area with use of AFFF reported by Arizona Air National Guard.	Currently part of Morris Air National Guard Base Remedial Investigation (Golden, 2023, Appendix B , Interviews and Site Visit Notes).
			AOC 15: Ascent Aviation Hangar 2	Hangar equipped with four stationary diaphragm proportioners with AFFF storage tanks. One accidental discharge of AFFF reported by site personnel.	Proceed to Site Inspection
			AOC 16: Ascent Aviation Fire Emergency Response	AFFF used during emergency response to a fire in 2010.	Proceed to Site Inspection

Table 3 (Continued)
Summary and Recommendations for Potential Aqueous Film-Forming Foam Areas of Concern

Grouping	Airport Zone	Location	Potential AFFF AOC	Rationale	Recommendation
Non-Fire Training Areas	Zone 2	Figure 3	AOC 17: Bombardier Building B	Hangar equipped with four AFFF hose stands.	Proceed to Site Inspection
			AOC 18: Bombardier Building D	Hangar equipped with four AFFF hose stands.	Proceed to Site Inspection
			AOC 19: Bombardier Building E	Hangar equipped with ten AFFF hose stands. One leak of AFFF concentrate in approximately 2020 reported by site personnel.	Proceed to Site Inspection
			AOC 20: Bombardier Building F	Hangar equipped with active AFFF FSS and one AFFF hose stand.	Proceed to Site Inspection
			AOC 21: Bombardier Building H	Hangar equipped with four AFFF hose stands.	Proceed to Site Inspection
			AOC 22: Bombardier Building J	Hangar equipped with four AFFF hose stands.	Proceed to Site Inspection
			AOC 23: Bombardier Building K	Hangar equipped with four AFFF hose stands.	Proceed to Site Inspection
			AOC 24: Bombardier Building S	Hangar equipped with active AFFF FSS. One leak of AFFF concentrate at the storage tank in 2023 reported by site personnel.	Proceed to Site Inspection
			AOC 25: Bombardier Building X	Hangar equipped with active AFFF FSS. Accidental releases of the FSS occurred twice, once in 2015 and once in 2016. One leak of AFFF concentrate at the storage tank reported by site personnel.	Proceed to Site Inspection
			AOC 26: Bombardier Building Y	Hangar equipped with active AFFF FSS.	Proceed to Site Inspection
			AOC 27: Bombardier Storage Conex	Unused AFFF stored at this location.	Proceed to Site Inspection
			AOC 28: Mitsubishi Heavy Industries Hangar	Hangar equipped with active AFFF FSS.	Proceed to Site Inspection
Non-Fire Training Areas	Zone 3	Figure 4	AOC 29: Current TAA Fire Station (B-284)	Unused AFFF stored at this location, as well as AFFF in vehicle tanks. AFFF is filled from containers into fire trucks at this building.	Proceed to Site Inspection
			AOC 30: TAA Fire Station Nozzle Testing Area	Former equipment testing area with use of AFFF reported by TAA personnel.	Proceed to Site Inspection
			AOC 31: Twin Engine (Piper PA30) Emergency Response	AFFF used during emergency response to a fire in 2010.	Proceed to Site Inspection
			AOC 32: Twin Engine (Beech BE300) Emergency Response	AFFF used during emergency response to a fire in 2017.	Proceed to Site Inspection
			AOC 33: TAA Maintenance Yard Emergency Response	AFFF used during emergency response to a fire in 2019.	Proceed to Site Inspection
			AOC 34: TAA Vehicle Maintenance Bays	Maintenance of AFFF-containing vehicles occurs at the maintenance facility.	Proceed to Site Inspection
			AOC 35: TAA Warehouse	Unused AFFF stored at this location.	Proceed to Site Inspection
			AOC 36: Millings Pile	Millings from miscellaneous runway and airport improvement projects are stored in the pile on native ground. AFFF may be present in the millings given the use of AFFF on runways and pavement across TUS.	Proceed to Site Inspection
			AOC 37: Wash Area	Former washdown area for vehicles including fire trucks used in the 1980s.	Proceed to Site Inspection
			AOC 38: Raytheon Building 845	Hangar equipped with active AFFF FSS.	Proceed to Site Inspection

APPENDIX B

Interviews and Site Visit Notes

Interview Questions Regarding Aqueous Film Forming Foam (AFFF) Use
Tucson Airport, Tucson, AZ

Respondent Name: TAA Fire Chief Tom Tucker

Date of Responses: 18 August 2023

Years Working at Tucson Airport: 23 years

1. When did AFFF first start being used at this airport?

FAA mandated predates TAA Fire Chief Tom Tucker; aircraft adopts when FAA mandated ~late 1960s/early 1970. USS Forestal incident.

2. What are the years of active use for each Fire Training Area (FTA)/ Part 139 certification AFFF training areas / ARFF training sites, Aircraft Hangar, Fire Department, other places AFFF may have been used (collectively Potential Areas of Concern [PAOC])?

Discharged foam since they adopted AFFF. East of firestation, in front of firestation, large burn pit where we have fuel farms now. Discharge area noted on Google Earth.

Area near Fuel farm – noted on Google Earth

East of TAA hangars

Intersection of Alpha/Delta/midpoint of further runway,

Bombardier has hangar discharges.

Mitsubishi never had a discharge.

3. What type of AFFF is used or has been used on this installation (i.e. 3%, 6%, High Expansion Foam [HEF])?

Long chain PFAS AFFF. Transitioned to short-chain. HEF did not use.

4. Are any film forming fluoroprotein (FFFP) extinguishers or systems used at the airport?

In 1940-70s mostly likely used a protein-based foam. TAA has historical photos.

5. What manufacturer's AFFF/non-AFFF products are used or were used on this installation (i.e. 3M, Ansul, Chemguard, etc.)?

Chemguard, 3M, Ansul.

6. Did you ever dispose of old bulk AFFF, if so, when and where?

Would keep unused foam. Containers up until ~6 years ago would go in the dumpster.

7. Is the AFFF stored as a mixed solution (3% or 6%) or do you formulate the AFFF on the installation?

n/a - Apparatus mixes. Discharge at a rate of 3%.

8. If AFFF is formulated on base, where is the solution mixed, contained, transferred, etc.?

n/a

9. Are your automated fire suppression systems currently charged with AFFF or have they been retrofitted for use of high expansion foam?

TAA doesn't own any foam based suppression systems. ANG and Mitsubishi have foam based systems. They are likely long-chain AFFF systems.

10. If retrofitted, when was that done?

n/a

11. Do you have an inventory of the amount of AFFF stored at the airport, now and in the past, or present in automated fire suppression systems? Were retention ponds built to store discharged AFFF? Was the AFFF trickled to the sanitary sewer or left in the pond to infiltrate?

Estimating a 4,000 gallon tank (at Mitsubishi). TAA - Keeps about 900-1,000 gallons in reserve in warehouse (containers). Interview amended 17 January 2024: TAA Fire Chief Tom Tucker stated that no retention ponds were built to store discharged AFFF.

12. Provide a list of vehicles that carried AFFF, now and in the past, and where are/were they located? Any vehicles have a history of leaking AFFF?

4 apparatus carry AFFF. 10-12 vehicles have carried AFFF since TAA Fire Chief Tom Tucker worked here. Vehicles located at Fire Station. Historical vehicles sold/donated.

13. How much AFFF (gallons) is/was carried/stored in the specified vehicles?

Guesstimate 1,000 gallons.

14. Do you ever dispose of unused AFFF? If so, how and where?

We have. During switch to short chain. Long chain disposed of by environmental team (all from trucks and stockpile) sent to installation for destruction. Becca Cammack (Director of Planning & Environmental Services) will check with SW hazard control. TAA Fire Chief Tom Tucker: moved to short chain in last ~6 years.

15. Has unused AFFF ever been disposed of in the past? If so, how and where?

See response to Question 14.

16. Do you/did you test the vehicles spray patterns (aka Part 139 certification ARFF truck foam proportioning system calibration) to make sure equipment is working properly?

Occurred at Fire Station; on quarterly basis. Mandated by FAA.

17. How often are/were these spray tests performed and can you provide the locations of these tests, now and in the past?

Quarterly. Fire Station.

18. Can you describe the procedure on how vehicles and systems are/were supplied with AFFF?

5 gallon buckets dumped into foam tanks; used buckets disposed of in dumpster (historically). Now used containers are packed in overpack container. Contractor comes out and picks them up.

19. Can you provide the procedures on how these vehicles are/were cleaned/decontaminated and where vehicle cleaning is performed currently as well as performed in the past?

Change from long to short: Triple rinsed and rinsate disposed of. After real world discharge, pipes with foam were filled with water and sprayed to clean pipe (either at the incident site or when returned to Fire Station).

20. Is/was there a specified area on the installation where vehicles are filled with AFFF and does this area have secondary containment in case of spills?

Filled at Fire Station. Secondary containment: no. drainage system in the station bays. Becca Cammack (Director of Planning & Environmental Services): Oil-Water Separator (OWS) which discharges to municipal separate storm sewer system (MS4), sampling happens quarterly. Discharge under permit with Pima County. Minor spills only.

21. When a release of AFFF occurs during a fire training exercise, now and in the past, how is the AFFF cleaned and disposed of?

Last 2 foam discharges, have been captured and remediated. One was accidental one was real world discharge (twin crash on ramp, ~2019). Approx 2 discharges since 2019, both remediated. Before approx. 2019, any discharges would have been left on ground.

22. How many FTAs are/were on this installation and where are they?

Have not had a FTA in approx. 30-35 years.

23. How many FTAs are active and inactive?

No active FTAs. No FAA training center.

24. What types of fuels/flammables were used at the FTAs?

Jet A, JP-A, AVGas anything left over may have been burned.

25. For inactive FTAs, when was the last time that fire training using AFFF was conducted at them? Find out ahead of time in Admin Record for former FTAs.

Might have log books in warehouse. 20-40 very large books.

26. What are/were the non-FTA locations where AFFF release systems are installed (i.e. Hangars, Wastewater Treatment Plants, Fire Stations, etc.)? Where are/were these locations (Building numbers)?

Bombardier had discharges. See map. Foam also used at Ryan Field (outside scope); maybe have been mutual aid response or possible TAA ARFF; very small discharge amounts.

27. Do you have a list (Building names and numbers, current and demolished) where the fire suppression systems either currently contain or have contained AFFF?

Not sure about Raytheon. Might have it but not sure. Foam based suppression at the Guard and Bombardier. Becca Cammack (Director of Planning & Environmental Services) reported Raytheon has suppression system but it has not been released.

28. Do you have records of fuel spill logs and emergency response logs? Knowledge of aircraft mishaps/crashes?

Office/records warehouse would have logs of aircraft crashes. Hand written docs.

29. Do you have recollection or records of AFFF being used as a precaution in response to fuel releases to prevent fires?

Probably has been done; can't think of anything specific for fuel spill since TAA Fire Chief Tom Tucker has been there. Predates TAA Fire Chief Tom Tucker, likely they may have foamed runways.

30. Do you have recollection or records of historical emergency response sites (i.e. crash sites and fires) where AFFF was used?

Likely yes, but unsure. Department has been around since 1948. Twin engine crash did have AFFF response. At Ascent on west ramp used foam for fires. Maybe twice a year, pre-2015. Foam used much more during certification process vs real world emergencies. Since 2020, TAA Fire Chief Tom Tucker can provide lat/long of incidents. Fire at maintenance (have records, was remediated) and accidental discharge during testing (was remediated). Since 2017, good records of discharges. Only use foam during Class B/flammable liquids directly contributing to a life/safety event. Will not discharge foam unless it is Class B.

31. Do you have recollection or record of emergency runway landings where foam might have been used as a precaution?

See response to Question 29.

32. If not written records or incomplete written records, do you have anecdotal/verbal information and locations of spills or other emergency response incidents where AFFF was used?

No other incidents recalled. Small discharges (20-30 gallons water/3% foam) probably not recalled; used previously on car fires.

33. What is the typical procedure for removing dispensed AFFF from an area where it has been used?

First time was fire at warehouse. Notifications made; environmental, beginning ~2017.

34. Can you provide any other locations where AFFF has been stored, released, or used (i.e. hangars, buildings, fire stations, firefighting equipment testing and maintenance areas, emergency response sites, storm water/surface water, waste water treatment plants, and AFFF ponds)?

Captured above.

35. Is there anyone else or other base organization personnel that you would recommend we interview? Name, organization, position, phone number, email.

Retirees. Becca Cammack (Director of Planning & Environmental Services) may be able to identify.

36. Was it common practice to wash away fuel spills with AFFF?

No.

37. Identify drainage patterns around flightline/ramp area. Point source discharge is likely AFFF Area of Concern (AOC).

Nearby washes. TAA will provide (SWPPP likely has info). Airport washes tributaries to Santa Cruz river. Discharge taken place on soil. Large reservoir at north end of airport property (Martin Reservoir) may have collected runoff from discharge area on the north end.

Marana Regional Airport (north of Tucson) – large discharge by TAA ARFF; Osprey incident, 1999/2000 timeframe. ANG, NW Fire, TAA ARFF mutual response.

Interview Questions Regarding Aqueous Film Forming Foam (AFFF) Use
Tucson Airport, Tucson, AZ

Respondent Name: Lee Golden

Date of Responses: 9/11/2023

Title: Morris Air National Guard (ANG) Environmental Manager

Primary goal of call is to understand the current nozzle testing area (Potential Release Location [PRL] 10 in the Preliminary Assessment). It is on Tucson Airport Authority (TAA) property and was excluded from the ANG Site Inspection.

ANG is now in the Remedial Investigation (RI) process. They've done some soil sampling at the current nozzle testing area, plus one monitoring well outside of their gate by airport wash at the corner.

ANG is in the process of purchasing that zone plus the area near Park and Valencia. It's nearing completion, not fully done. She will ask her real property manager for an update.

Jose Hurtado – National Guard Bureau Project Manager from Joint Base Andrews – Ahtna is their contractor

- Worked with Tucson Airport Remediation Project (TARP) long ago.
- She'll ask him what information they can send to us.

RI Quality Assurance Project Plan (QAPP) is done. 10 monitoring wells and 25 soil borings are completed. Planning to do stormwater and sediment. The RI report won't be complete until 2024.

Her email: genevra.golden@us.af.mil

Tucson Airport AFFF PA Site Visit

9/11/2023

Kristi Diller

8:20 - Meet Becca Cammack @ TAA offices

9:00 - Fire station with Chief Tom Tucker

Log books from 2001 to present → three books

-Alert 3

-Refract → refractometry testing by fire station

-foam

Alpha 17 Runup Pad

~~near~~ south of millings pile

-used for tri-annual (every 3 years) AFFF training

Tom Tucker stays at station while we move on.

10:00 - drive SE of fire station

-sweeping pile → is that Alpha 17 Runup Pad?
-now sweeping pile goes to maintenance yard

- millings pile

- from misc construction/runway projects

- unknown origin

- there's a N-S ~~training~~ drainage to west

10:20 - Airport Wash

-flows to NW on north side of airport

-eventually discharges to Santa Cruz river

- usually dry, only flows during storm events

10:45 - Meet w/ Adam Kretschmer for movement area access

-Escorted to movement area sites by Frank Ruiz

11:50 - Return to TAA offices

1pm - 3:30pm - Interviews w/ Sarah Simmons, Chris Schmalz, and Lee Golden
(GHD) (TAA Legal) (ANG)

3:30pm - review three logbook from fire station (2001 to 2008)

- list calls for fire and spill response and foam testing, but no info about response type, testing volumes, or specific locations

Tucson Airport AFFF PA Site Visit

9/12/2023

Kristi Diller

8:05 - Meet Becca at TAA office

8:30 - Visit areas on west side of TAA

9:00 - Visit Bombardier w/ Kevin Mirlocca, Wolverine Fire Protection, CO.

10:50 - Visit MHI w/ Kevin Mirlocca

11:30 - Visit Raytheon w/ Mike Crosby, Facilities Director

12:30 - lunch

1 pm - Visit Ascent Aviation w/ William Johns, Site Manager

2pm - Alan Moseley, TAA supervisor of Fleet Maintenance

3pm - Eder Delgadillo, former TAA Env. specialist

4pm - visit twin engine crash site

4:20 pm - depart TAA

9/13/2023

11:45 pm - Visit warehouse AFFF storage

9/11/23

Location: Fine station

Description/history/use:

- built
- 1978

- Older fire station
- adjacent to terminal → where ACC is now - 1960s to 1978 - demolished
 - west ramp → 1940s - 1960s → demolished
 - washing occurs on ^{apron} ~~ramp~~ outside
 - 4 vehicles that currently contain ~~AFFF~~
 - another one previously did
 - ~~AFFF~~ stored in shed
 - brought into bays to fill vehicles
 - tested in 200' arc to the NW to SE

Surface water pathway or other drainage features:

inside station - 4 bays w/ drains that go to 1 OWS on south side of bldg
- Becca says not fully operational

OWS → goes to sanitary sewer
MS4 permit - quarterly sampling → no AFS requirement
- OWS pumped out quarterly by haz waste operator

Soil/sediment features:

grassy / cracks in concrete apron

**Tucson Airport AFFF Preliminary Assessment
Site Visit Notes**

Location: Fire Station to Former FTA

9/11/23

Description/history/use:

- Designated AFFF/ PFAS Waste Storage
 - used for PPE
 - secondary containment
- Fuel Farm D
 - ~~was~~ site of former FTA
 - Becca says area collects stormwater and sump overflows → no discharge, gets pumped out
Busy D company ↓
discharge by permit to

Surface water pathway or other drainage features:

- no clear drainage pathway
- Airport Wash to north

Soil/sediment features:

- open soil/native veg

**Tucson Airport AFFF Preliminary Assessment
Site Visit Notes**

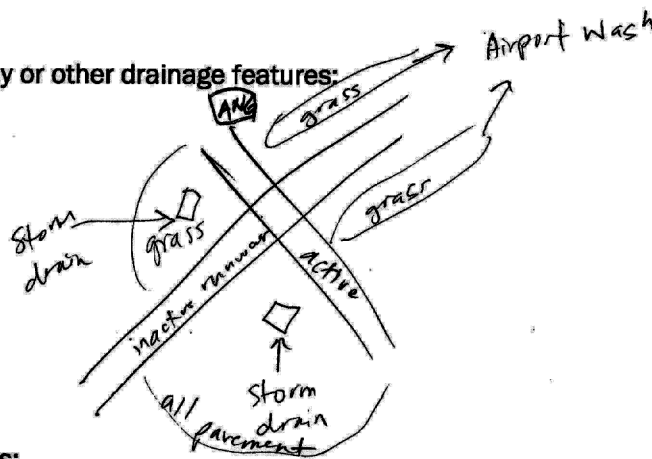

2/11/2023

Location: Runway Intersection Testing Area

Description/history/use:

annual FAA testing location for TAA

Surface water pathway or other drainage features:

Soil/sediment features:

in grassy zones

**Tucson Airport AFFF Preliminary Assessment
Site Visit Notes**

Location: TAA Hangars Former Fire Training Area

9/11/2023

Description/history/use:

- currently used for old plane storage

Surface water pathway or other drainage features:

- storm drains in concrete ~~and in grassy~~
to NW side of area
- concrete seems to drain to NW

Soil/sediment features:

- broken concrete

**Tucson Airport AFFF Preliminary Assessment
Site Visit Notes**

9/12/2023

Location: Old Landfill
and
Fuel Farm Area (Former fire training?)

Description/history/use:

We have this fuel farm area marked on our Google map.

TAA Landfill closed before 1970, according to EDR report.

Between fuel farm and old landfill is a gravel pad w/ concrete boxes and fire towers

Surface water pathway or other drainage features:

Soil/sediment features:

Open/native veg

**Tucson Airport AFFF Preliminary Assessment
Site Visit Notes**

9/12/2023

Location:

Former Firebill Area D-3

Description/history/use:

from EDR

~~Old~~ Warehouse built on former site

Surface water pathway or other drainage features:

None obvious

Soil/sediment features:

Now all paved

9/12/2023

Location:

Bombardier

Kevin Mirlocca
Wolverine Fire Protection, Co.
→ since 2015

Description/history/use:

- 36 areas of AFFF storage
- yes have had release → Oct 16, 2015, fire suppressions system false
June 29, 2016, reactivated
- and minor spills (w/in 5 gallon range)
 - ruptured metal barrel

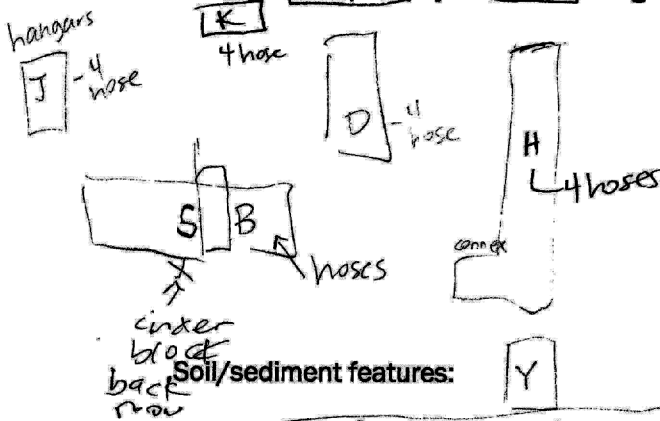

↓ due to pull station getting wet during storm.
- replaced all 40 w/ explosion proof and mounted away from wall

- 1 storage location
- every hangar has AFFF
 - whether overhead or a hose/siphon system
- 4 large storage tanks
 - 2 of those where spills have occurred
- 31 hose stations (50 gallon drums)

*get list of hose stands in bldgs

F-1
E-10

Surface water pathway or other drainage features:

Four Overhead Foam Fire Sp

- Bldg F
- S ~ 2,400 gal tank
 - X - 2,400 gal tank
 - Y - 2,400 gal tank

AeroPark Rd Bldg S - small spill - dispensing piping welds rotted through, dripped out

- summer 2023
- no drains, just concrete floor
- Kevin cleaned up w/ buckets/ → 4 gallons captured → reused into 50 gallons
- US Ecology handles waste (PIG mats) → added to haz waste

- Bldg S - 6 zones suppression system # 6 down stairs
 - mechanics hangar
 - big white pipes in ~~street~~ ceiling are in pump room
- Bldg B - 4 hose stands
 - example hose stand
 - alcohol based foam 3-6%
 - plastic drum
 - on concrete
 - water piping, mixes on demand
 - no memory of hose stands being used (Kevin wants to remove systems. TAA FD would respond w/ their own equipment)
- Bldg D - 4 plastic
- Bldg R - 4 ^{steel} drum
- Bldg X
 - tank has label
 - leak @ ball valve
 - similar to Bldg S
 - 2,400 gallons
 - pull station in NE corner failed due to water
 - first thought roof
 - then realized it was thru cinder block metal
 - 2 collection drains → pumped out (us Ecology - Ali)
Kevin not sure ↳ Bombardier's Env Contractor
 - full tank both time - Kevin says mostly contained by drains
 - 1st time - the stock room in hangar had pipe burst - env company cleaned it up
 - stock room is above pump room

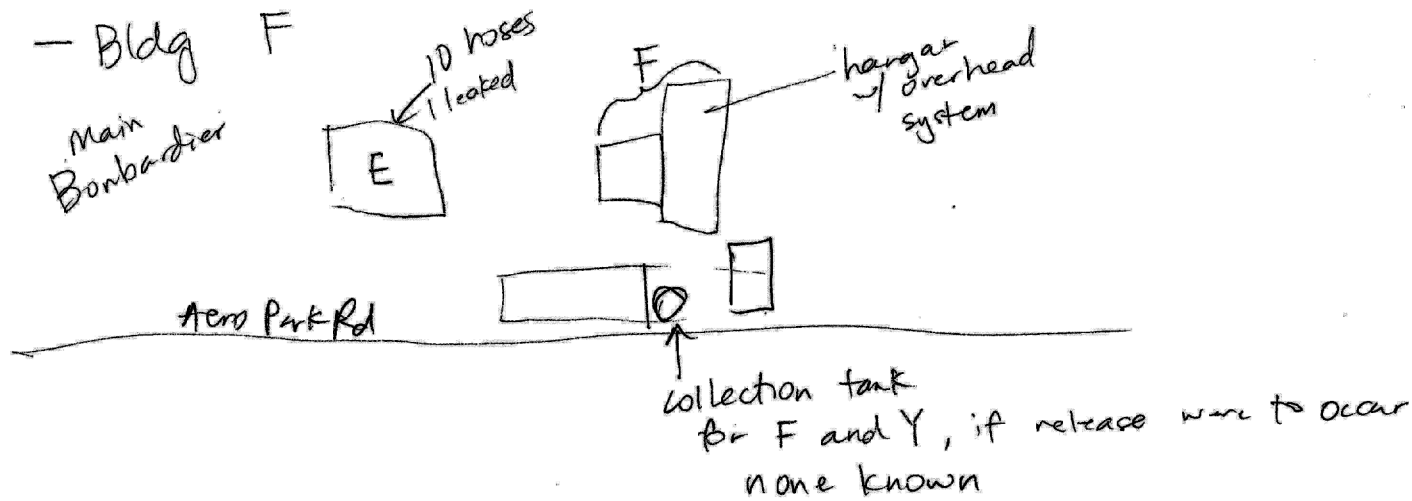

- storage ~~shed~~ connex on west side Bldg H
- three plastic drums of AFFF stored in

- Bldg Y

- tank 2,400 gallon
- Kevin doesn't know of any leaks/discharges
- recovery pit and drains in center of hangars goes into recovery tank @ Bldg F via underground piping

- S + X have drains/catchments not

- Bldg F
Main Bombardier

Bldg E - 10 hose stands
 - NW corner of bldg hose stand
 - couple years ago, maybe 3 had leak from steel drum, replaced w/ plastic drum

- hose stationed

Bombardier

9/13/2023

Bldg F - storage in the hangar

- overhead system
- 1 overhead hose
- vertical tank, 1800-2000 gal
- NW corner of hangar portion of bldg

MHI

- Wolverine since 2009, Kevin since 2015
- purchased from Bombardier in the last year

- water in 2 large tanks w/ fire pump room beside
- hangar has 13 risers across hangar
- 2 x 4200 tanks
 - boosters pump foam into hangar
- on NW side of hangar in ~~the~~ middle door (roll up) mechanical room
- ~~the~~ little spill < 1 gal @ valve piping - 2 years ago
- US Ecology also env manager
- drain on front by hangar doors 10' by 4' deep pumped out of there

9/12/2023

Location:

Ascent Aviation

William Johns
29 years

Description/history/use:

started 1995 - Hamilton Aviation

Hangar 2

- 4 ^{small} foam tanks w hoses and water inputs
- ~7 gallons in each one

One incident

- accidental release 2010 or 2011
- someone filled a bucket ^{of foam} when they meant to get water
- hosed it out through the front door of hangar
- mixture → probably a quart of AFFF

Hangar 3

- F200 tanks in other hangar → installed 2014

Surface-water pathway or other drainage features:

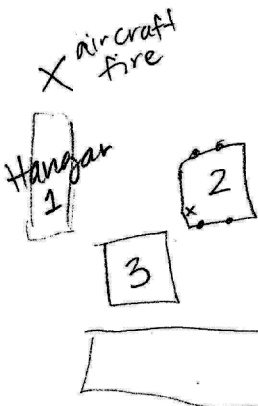

- ~~Don~~ Shanbaugh & Son LP ~~does~~ does inspections (collect samples)
- no testing on site
- *Becca will get the ins

- Used to have 5 gallon containers

- drained tank, foam offsite
- mechanics then filled it with new foam
- that was before 2010, can't remember the brand

Soil/sediment features:

- Western States took extra containers off site

- Sump in center of hangar 2

- closed
- pumped into totes and tested shipped accordingly
- but no known releases of AFFF into sump

- fire incident

when Hamilton Aerospace Technology

- plane got pushed into live fire line
- foam was used by FD
- between 2003 and 2010
- concrete, no storm drains

9/12/2023

Location:

Raytheon

Mike Crosby
Facilities Director

Description/history/use:

No photographs

- Bldg 845 hangar on NE.
- Ansilite 3% (maybe used to 6% based on scratch act here)
- ~3000 gallon AFFF horizontal tank stored in "pump house"
- 2019 full containment
- before that 3% + 80 gallon 3x100 ml test sample
 - released rst to tarmac on east of hangar
 - annually.

Kenneth
~~Kevin~~
Daniel

About 2011 the ^{main portion} hangar was put in place

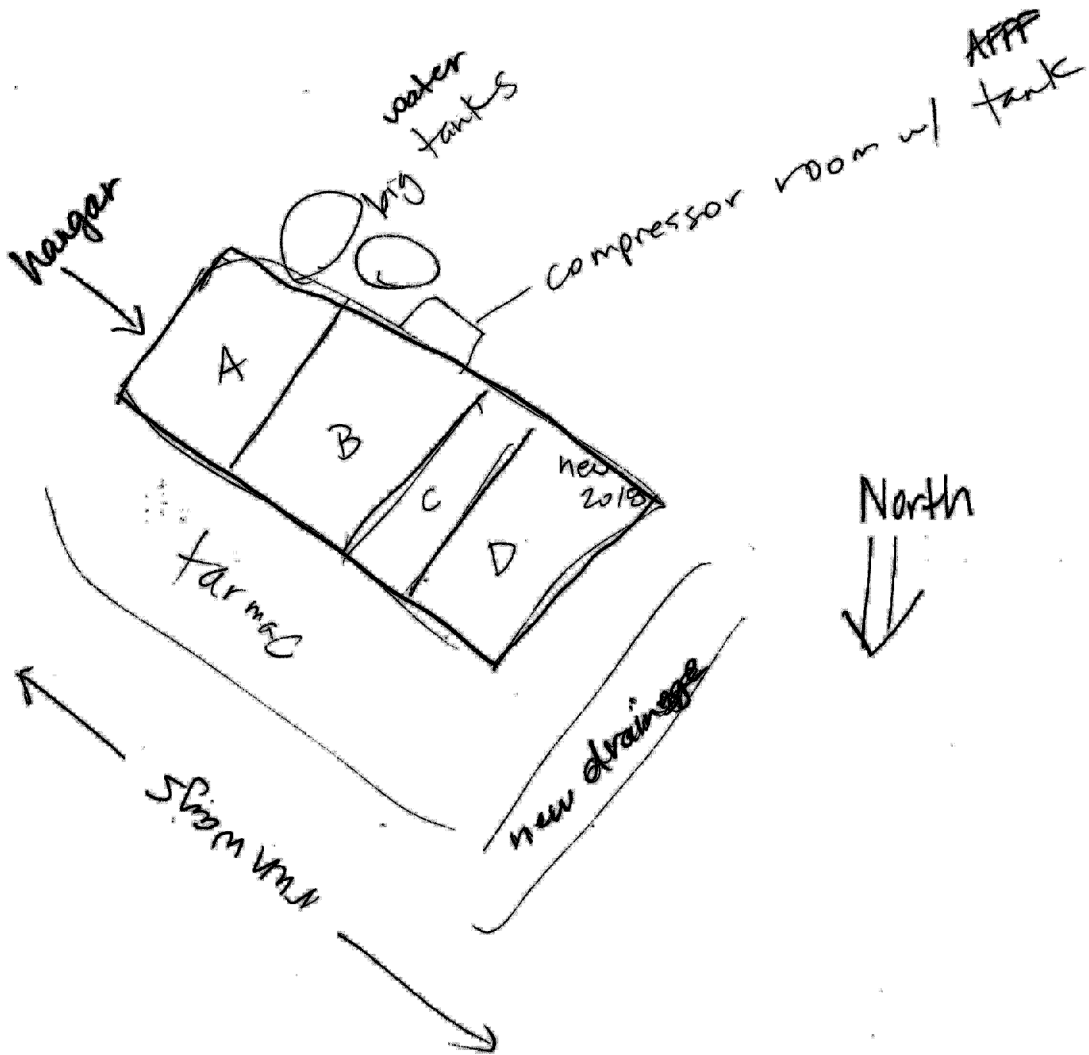

Surface water pathway or other drainage features:

- tank has tag that say ^{year} 2000
- deluge system
- tank is clean, no evidence of leaks

Soil/sediment features:

- the one newest bay was built in 2018
 - one initial test performed
 - collected in drain system* BWS w/ catch tank
- when testing occurred in Bay C, they'd put it on concrete, let air dry, never made it to the drainage even
- drainage basin built 20 years ago

Raytheon Sketch

Tucson Airport AFFF Preliminary Assessment
Site Visit Notes

Location:

9/13/2023

TAA Warehouse

Description/history/use:

Storage of AFFF

5 gallon buckets on pallets on
Secondary containment

7 pallets total

5 → 3 × ~~4~~ × 3 = 36 5-gallon containers on each
pallets containers

1 ~~2~~ pallet = 45 ~~4~~ 5-gallon containers
($\frac{4 \times 2 \times 4}{8} + 13$)

1 pallet = 46 5-gallon containers

Surface water pathway or other drainage features:

On secondary containment
No history of spills

Soil/sediment features:

None

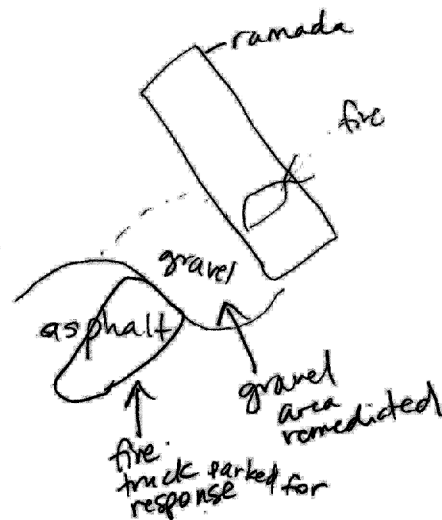

Alan Mosley

at TAA
started 2017

9/12/2023

emergency response

- MS Machine - crack sealer - spontaneous combusted
- 4x4 rosenbauer responded
- back ramada
- maybe occurred late 2018
- he'll look for date
- had remediation of soil impacts

AAFF changeout

Sept-ish 2019

- drain vehicle into totes → concentrate
- then fill w/ water → rinse
- triple rinse containerized
- on the 4th fill
- flushed piping into tarped jersey barrier
- ask Eder about what happened with that
- did it with 3 AAFF-carrying vehicles
- FD bought 1 new vehicle since then (that's the current 4th)

- no drains,
- low point

~16

totes were stored @ maintenance for awhile and then moved to near SkyChef for pickup for final disposal

- totes airside (inside fence)
- soil from remediation landside (public-facing area)

Eder Delgadillo

9/12/2023

Southwest Hazard

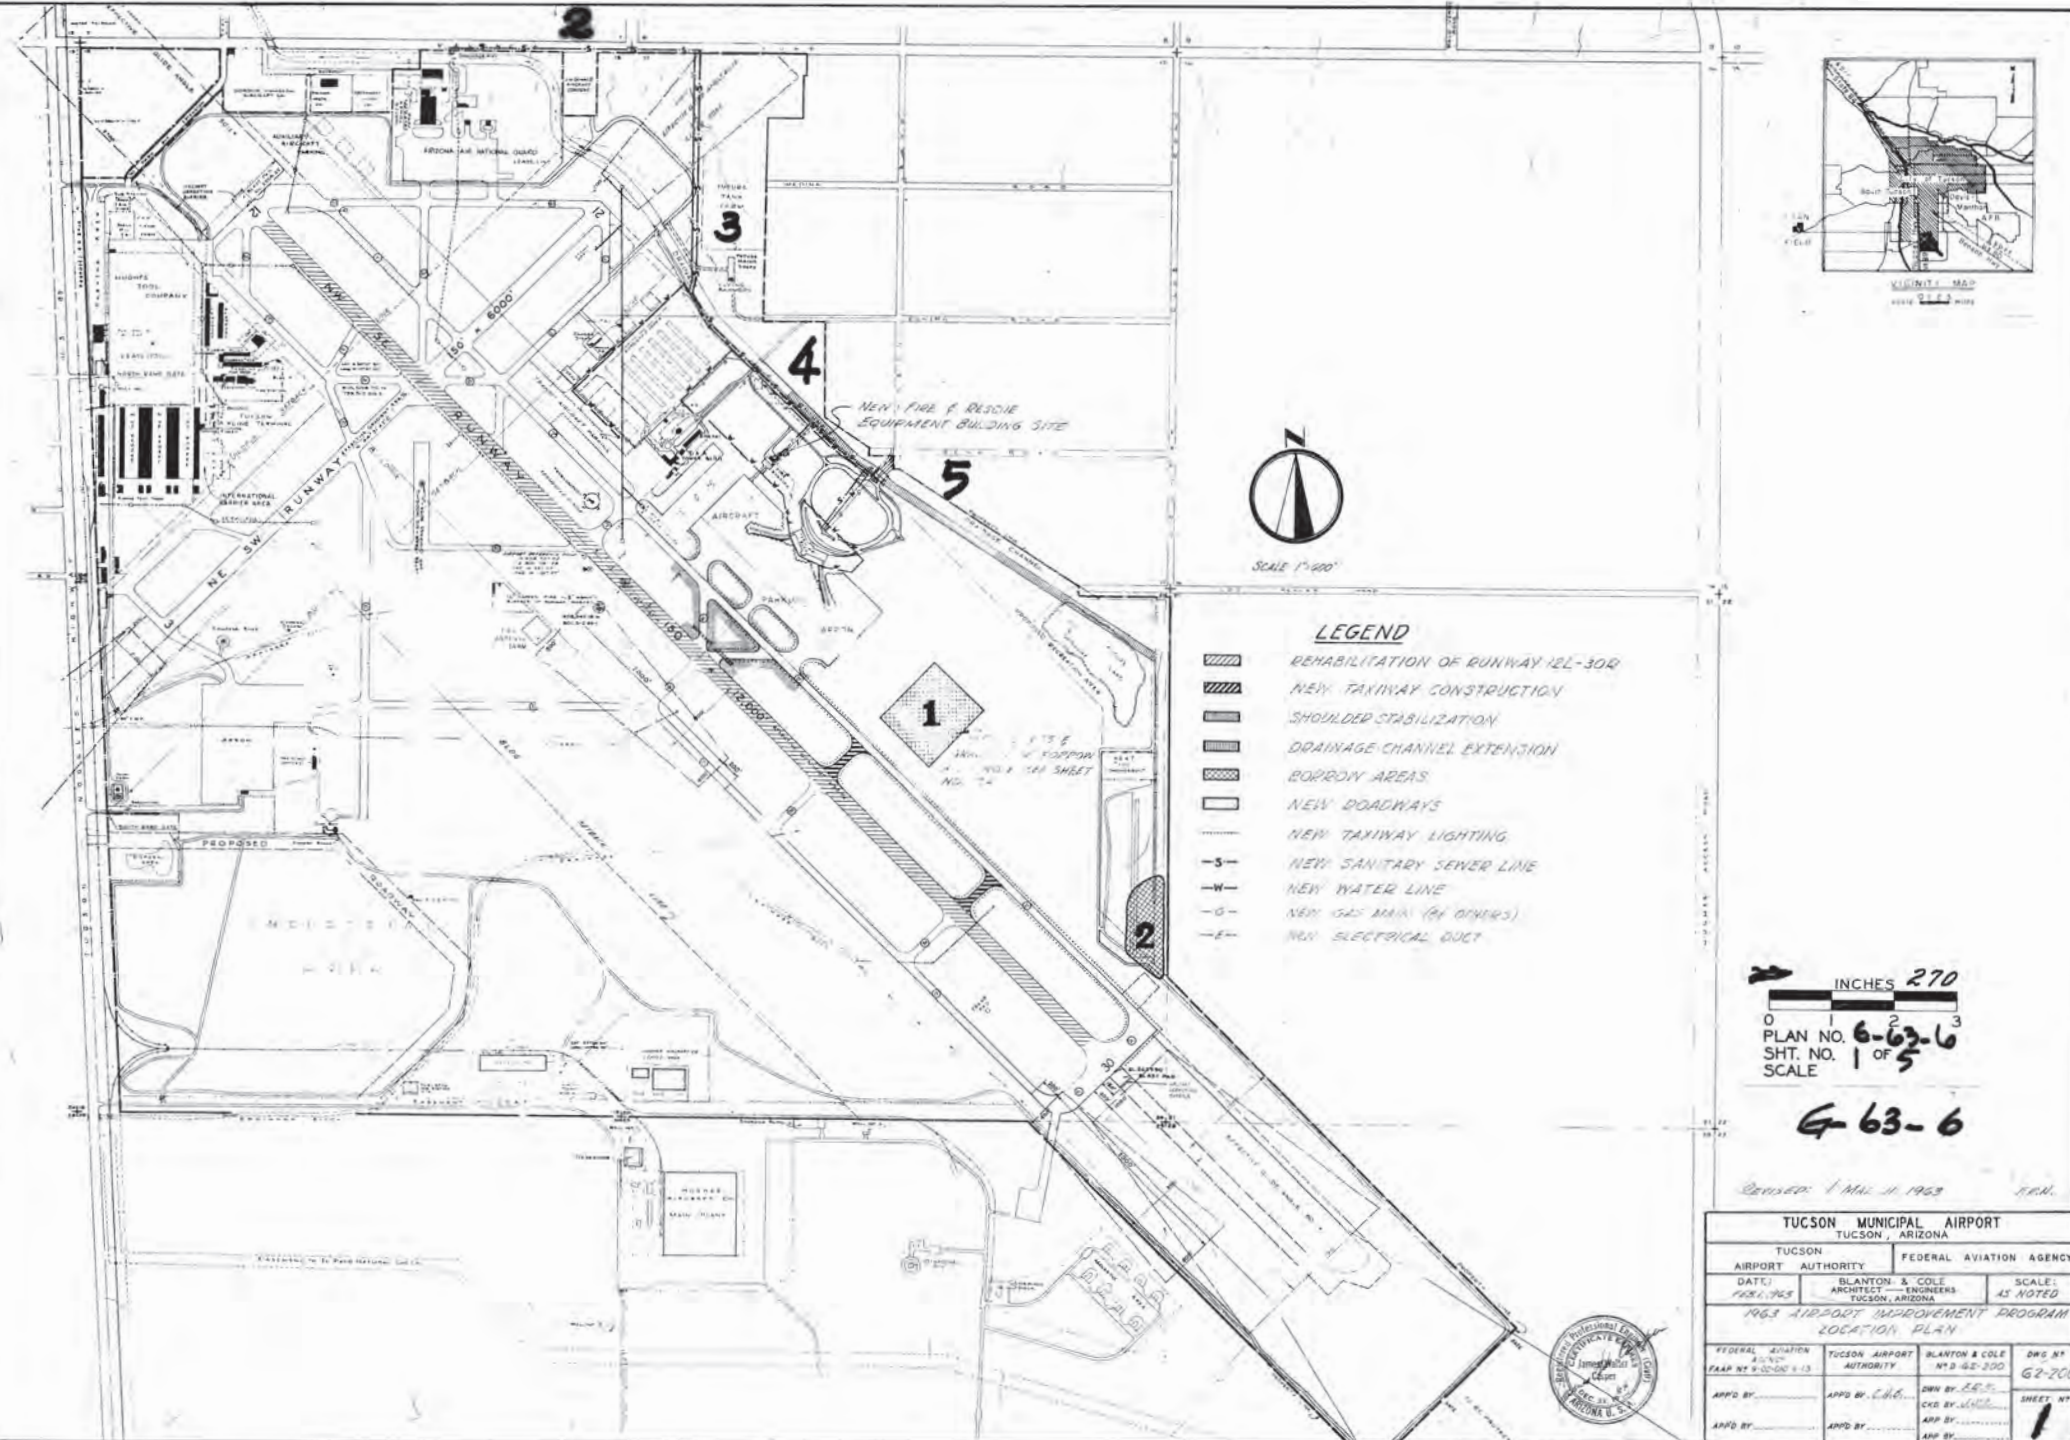

- left airport Sept 2021, started in 2019
- 1 year @ SW Haz
- CB was from same manufacturer as ~~same~~ CB (Chemguard)
- Jersey barriers for ^{final AFFF cleanout} near TIC
 - dried out
 - cut up and placed in 1yd box w/ liner on 4x4 pallet
 - sent to USEcology, Beatty, NV
- totes also went to US Ecology
 - AFFF onc
 - AFFF rinsate
 - AFFF ^{insoluble} solids (PPE, etc)
- soil remediation project from maintenance yard fire
 - also went to US Ecology
- Sky Chef airside location selected due to secondary containment of loading dock
- describes process where the fire trucks are tested and the AFFF waste goes into the PFAS-waste ~~test~~ tote in South side of container
- use a food-grade defoamer
- Maintenance of fire trucks occurs in the bays
 - before Eder, may not have been managed as well
 - could have been historical releases
- east of TIC fire training - foam into an HDPE secondary containment, 4' high walls
 - Eric ordered it cause FD needed to test, Eder checked it, up for months, cut up sent to US Ecology

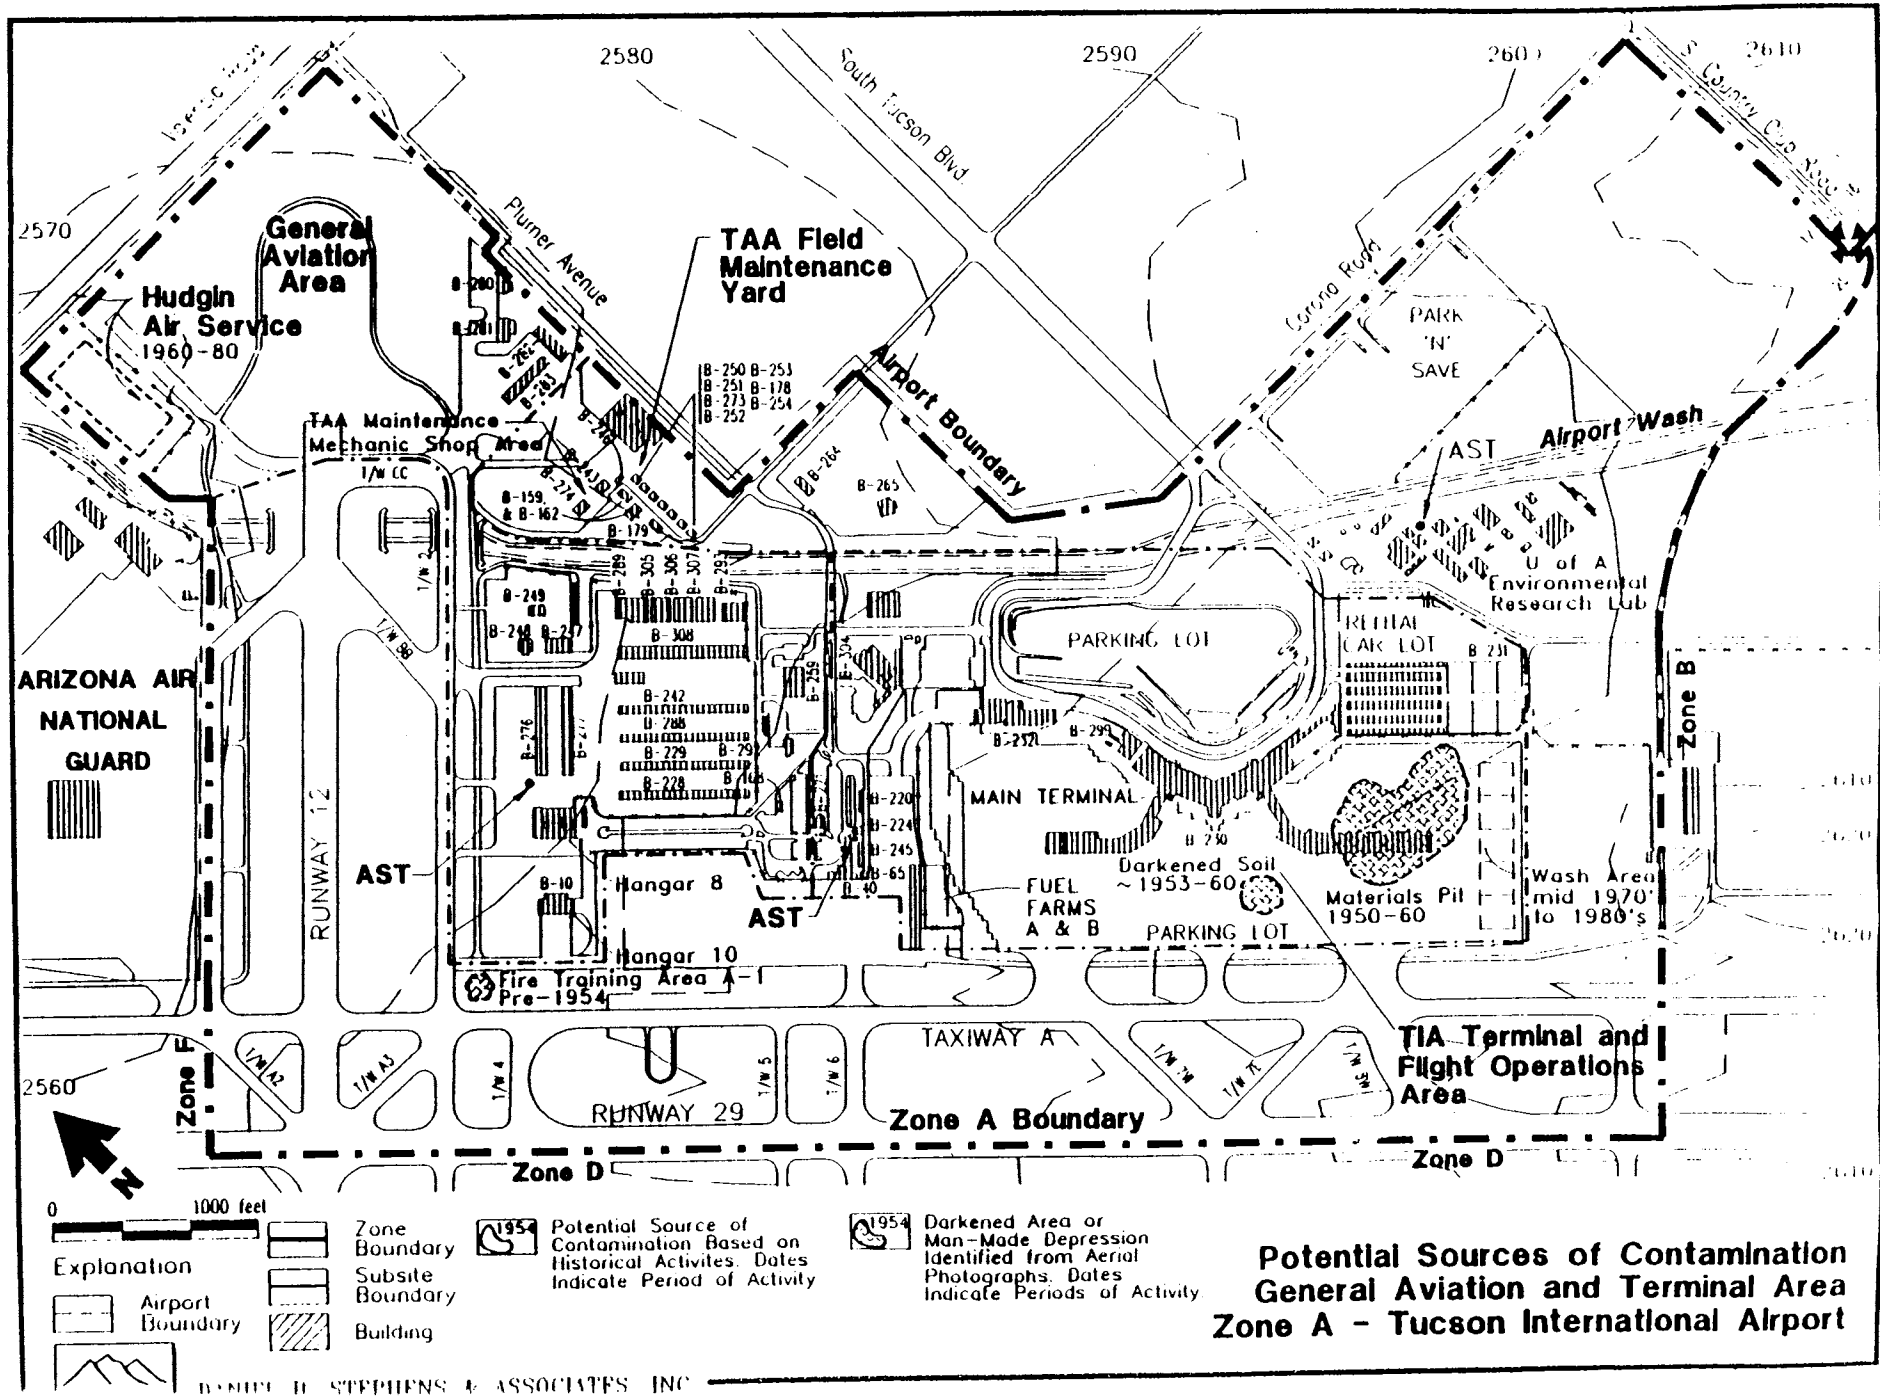

- quarterly testing of foam discharge
 - pre no-foam, they were carrying to a pallet near the connex shed in the fire station parking lot
 - Eder proposed the current system with testing at the PFAS waste containers
- for remediation
 - ~~was~~ within a week after the fire
 - no testing performed
 - used visual impacts of wet soil
 - excavated from ~2' & up to 5'
 - filled w/ clean fill
